# MAURICIO CERDA

# LAB “BIO-RELATED”: IMAGE PROCESSING METHODS FOR MICROSCOPY IMAGING

- La Serena, 8/24/2017 -

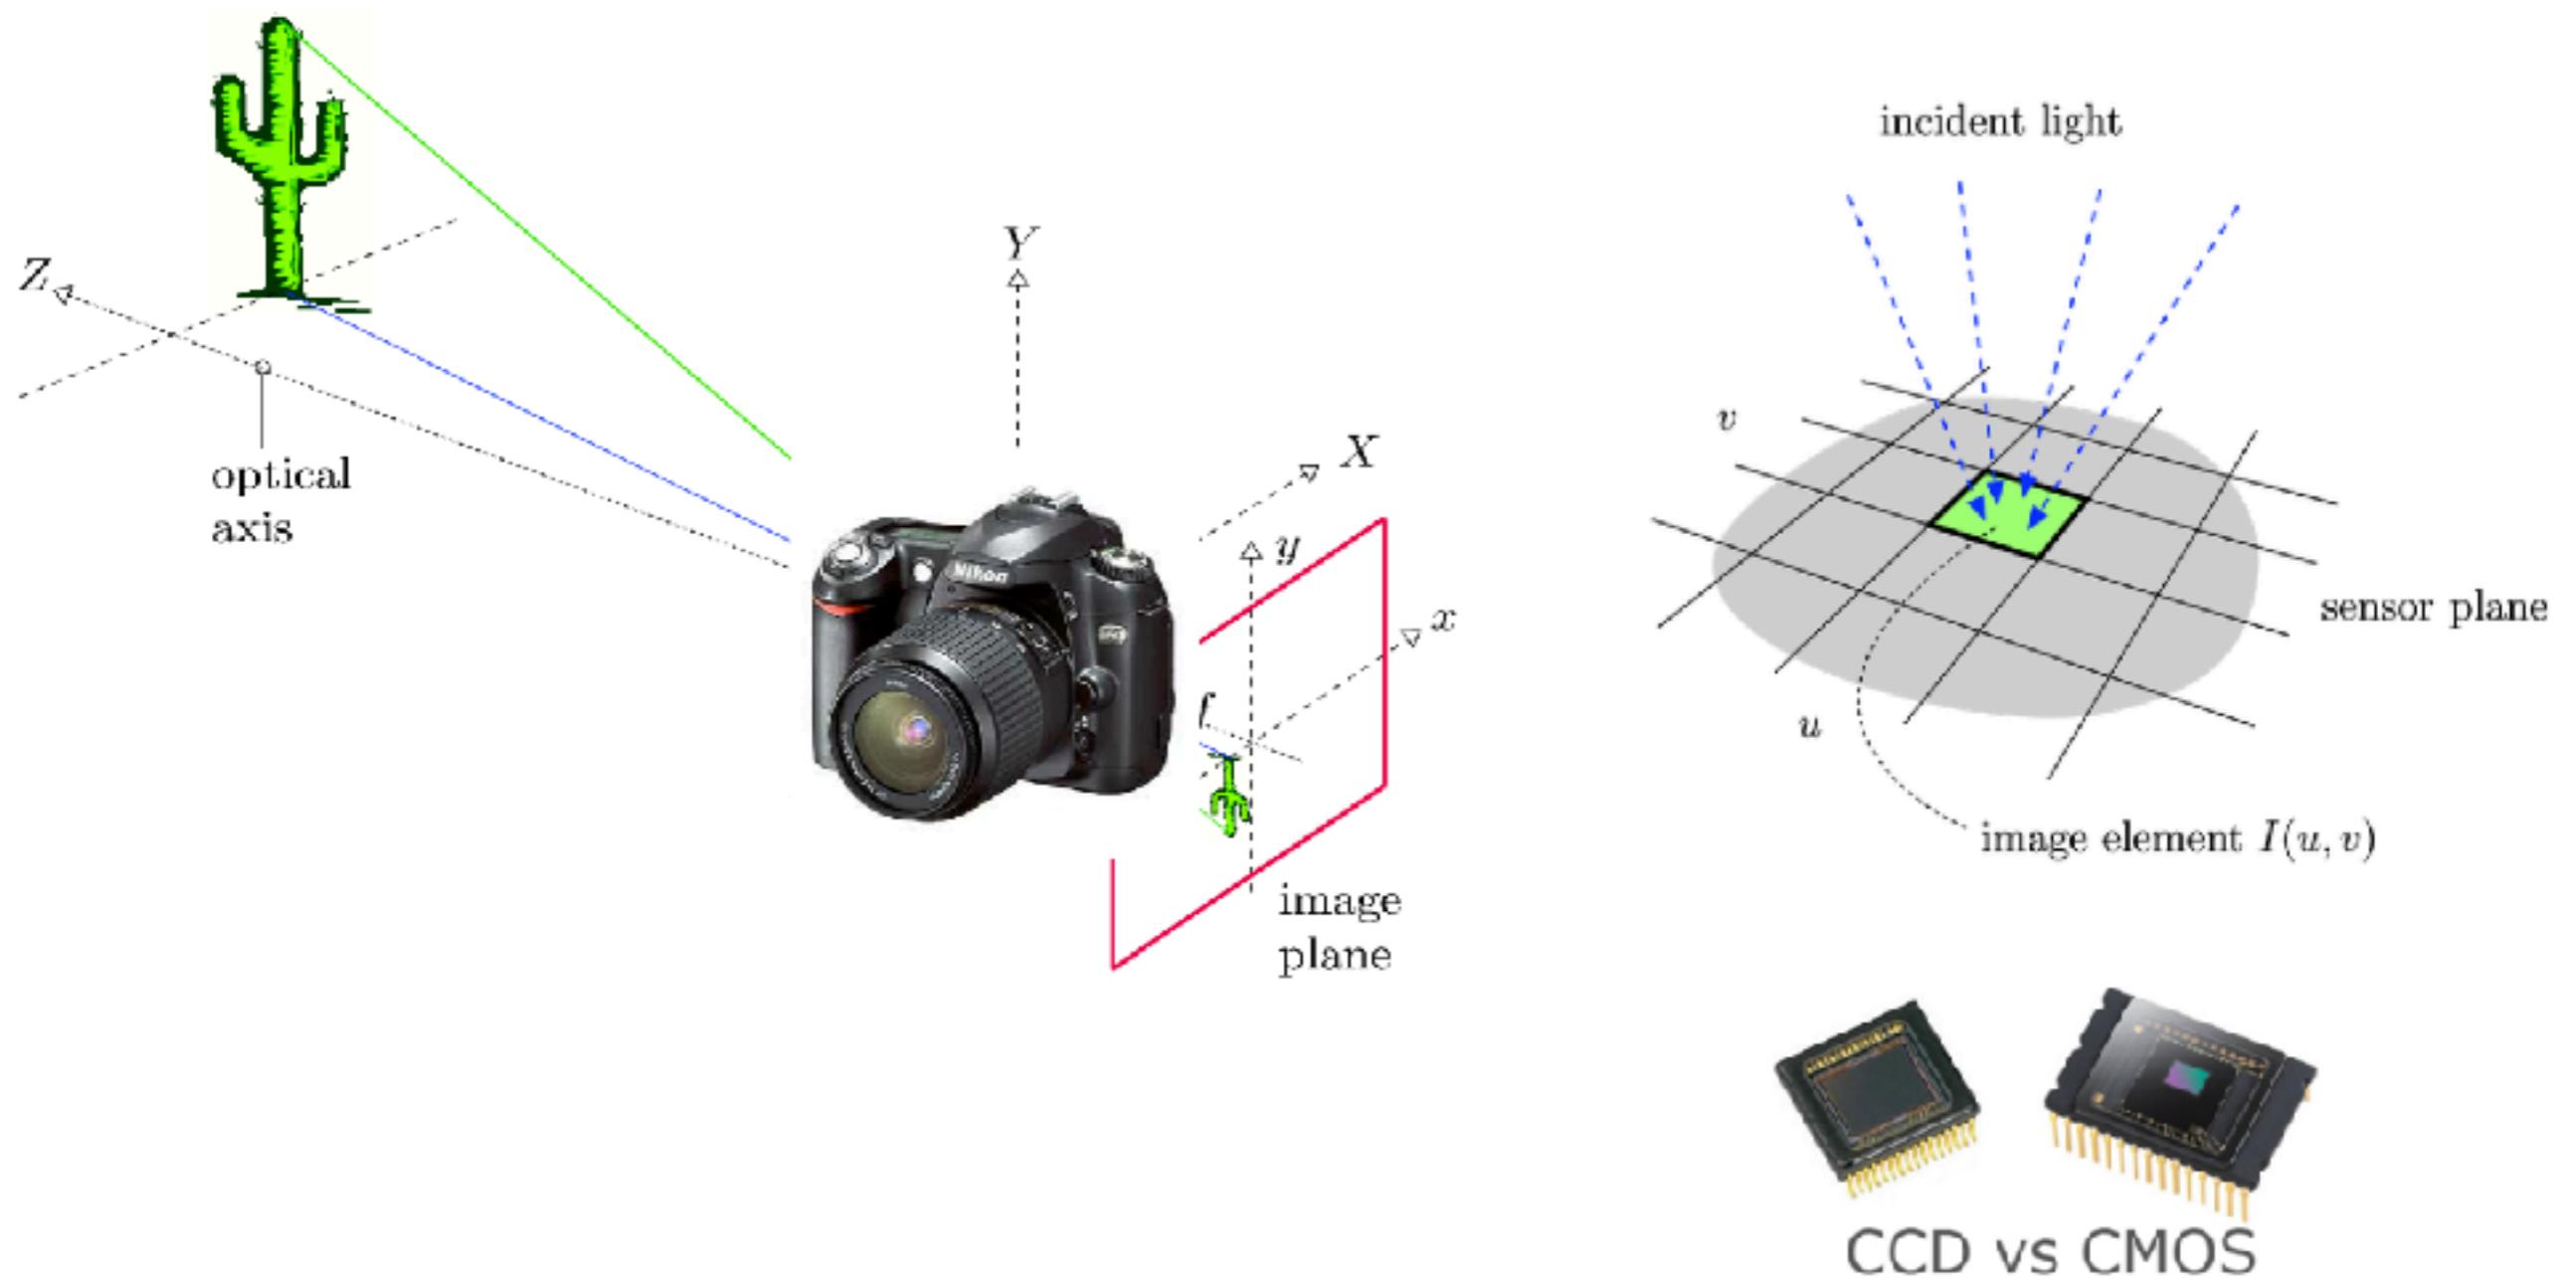

## OUTLINE

---

- ▶ Image processing?
- ▶ Segmentation (clustering)
- ▶ Shape description (PCA)
- ▶ Lab: challenge !

## IMAGE PROCESSING: IMAGE

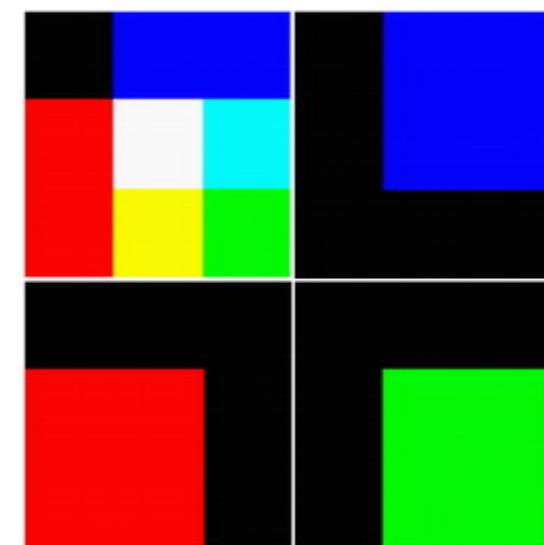

- ▶ **Image:** is an artifact that depicts visual perception, for example, a photo or a two-dimensional picture, that has a similar appearance to some subject—usually a physical object or a person, thus providing a depiction of it [wikipedia, 2017].

# IMAGE PROCESSING

---

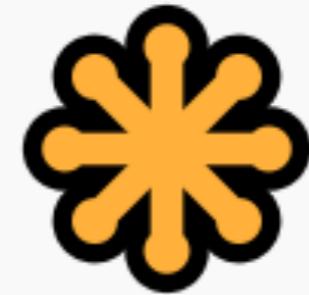

- ▶ Raster image:
  - ▶ Array or matrix of pixels with spatial coordinates  $I(x,y)$ .
  - ▶ A numerical value or color per location.

|             |               |               |               |
|-------------|---------------|---------------|---------------|
| 0 0 0 0     | 0 0 255 0     | 0 0 255 0     | 0 255 255 255 |
| 255 0 0 0   | 255 255 255 0 | 255 255 255 0 | 0 255 255 255 |
| 255 0 0 0   | 255 255 0 0   | 255 0 0 0     | 0 0 0 0       |
| 0 0 0 0     | 0 0 0 0       | 0 0 0 0       | 0 0 0 0       |
| 255 255 0 0 | 255 255 0 0   | 0 255 255 255 | 0 255 255 255 |
| 255 255 0 0 | 255 255 0 0   | 0 255 255 255 | 0 255 255 255 |

- ▶ Vectorial image:
  - ▶ Defined by basic functions (points, lines), instead of pixels.
  - ▶ To be displayed on screen needs to be rasterized (transforms to a raster image).
  - ▶ Raster or Vectorial in a paper?

## Scalable Vector Graphics

```
<?xml version="1.0" encoding="UTF-8"?>
<svg version="1.0" xmlns="http://www.w3.org/2000/svg">

</svg>
```

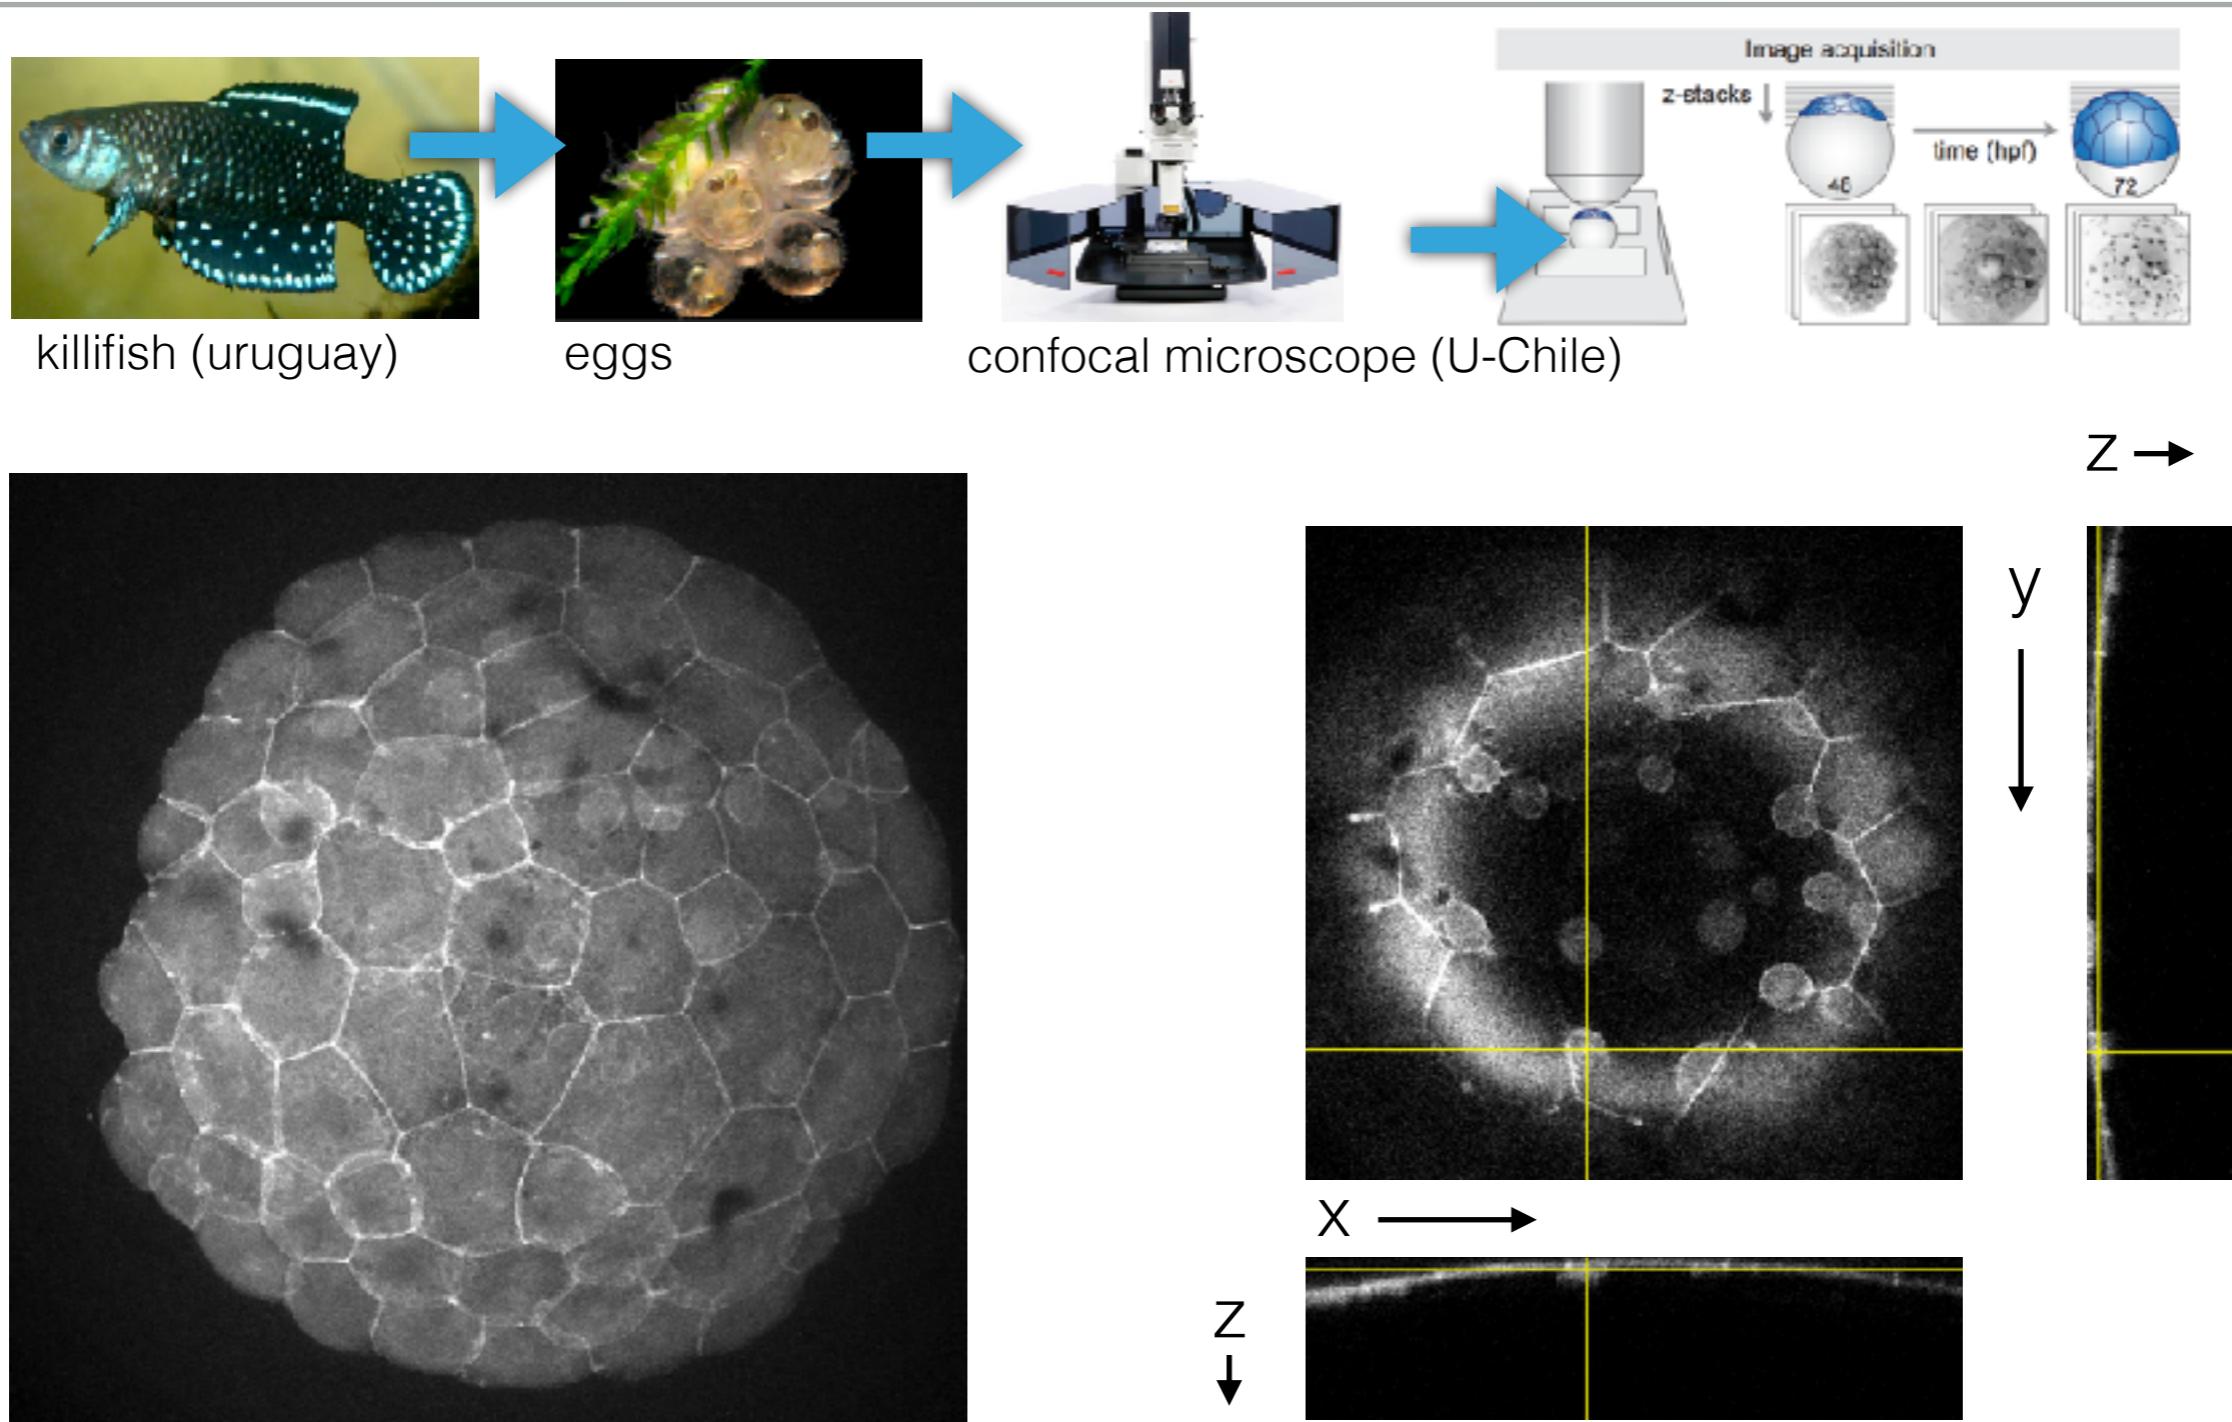

## IMAGE PROCESSING

---

- ▶ We want to process images to understand biological systems (models):
  - ▶ Tissue development
  - ▶ Medical imaging (parasites counting)

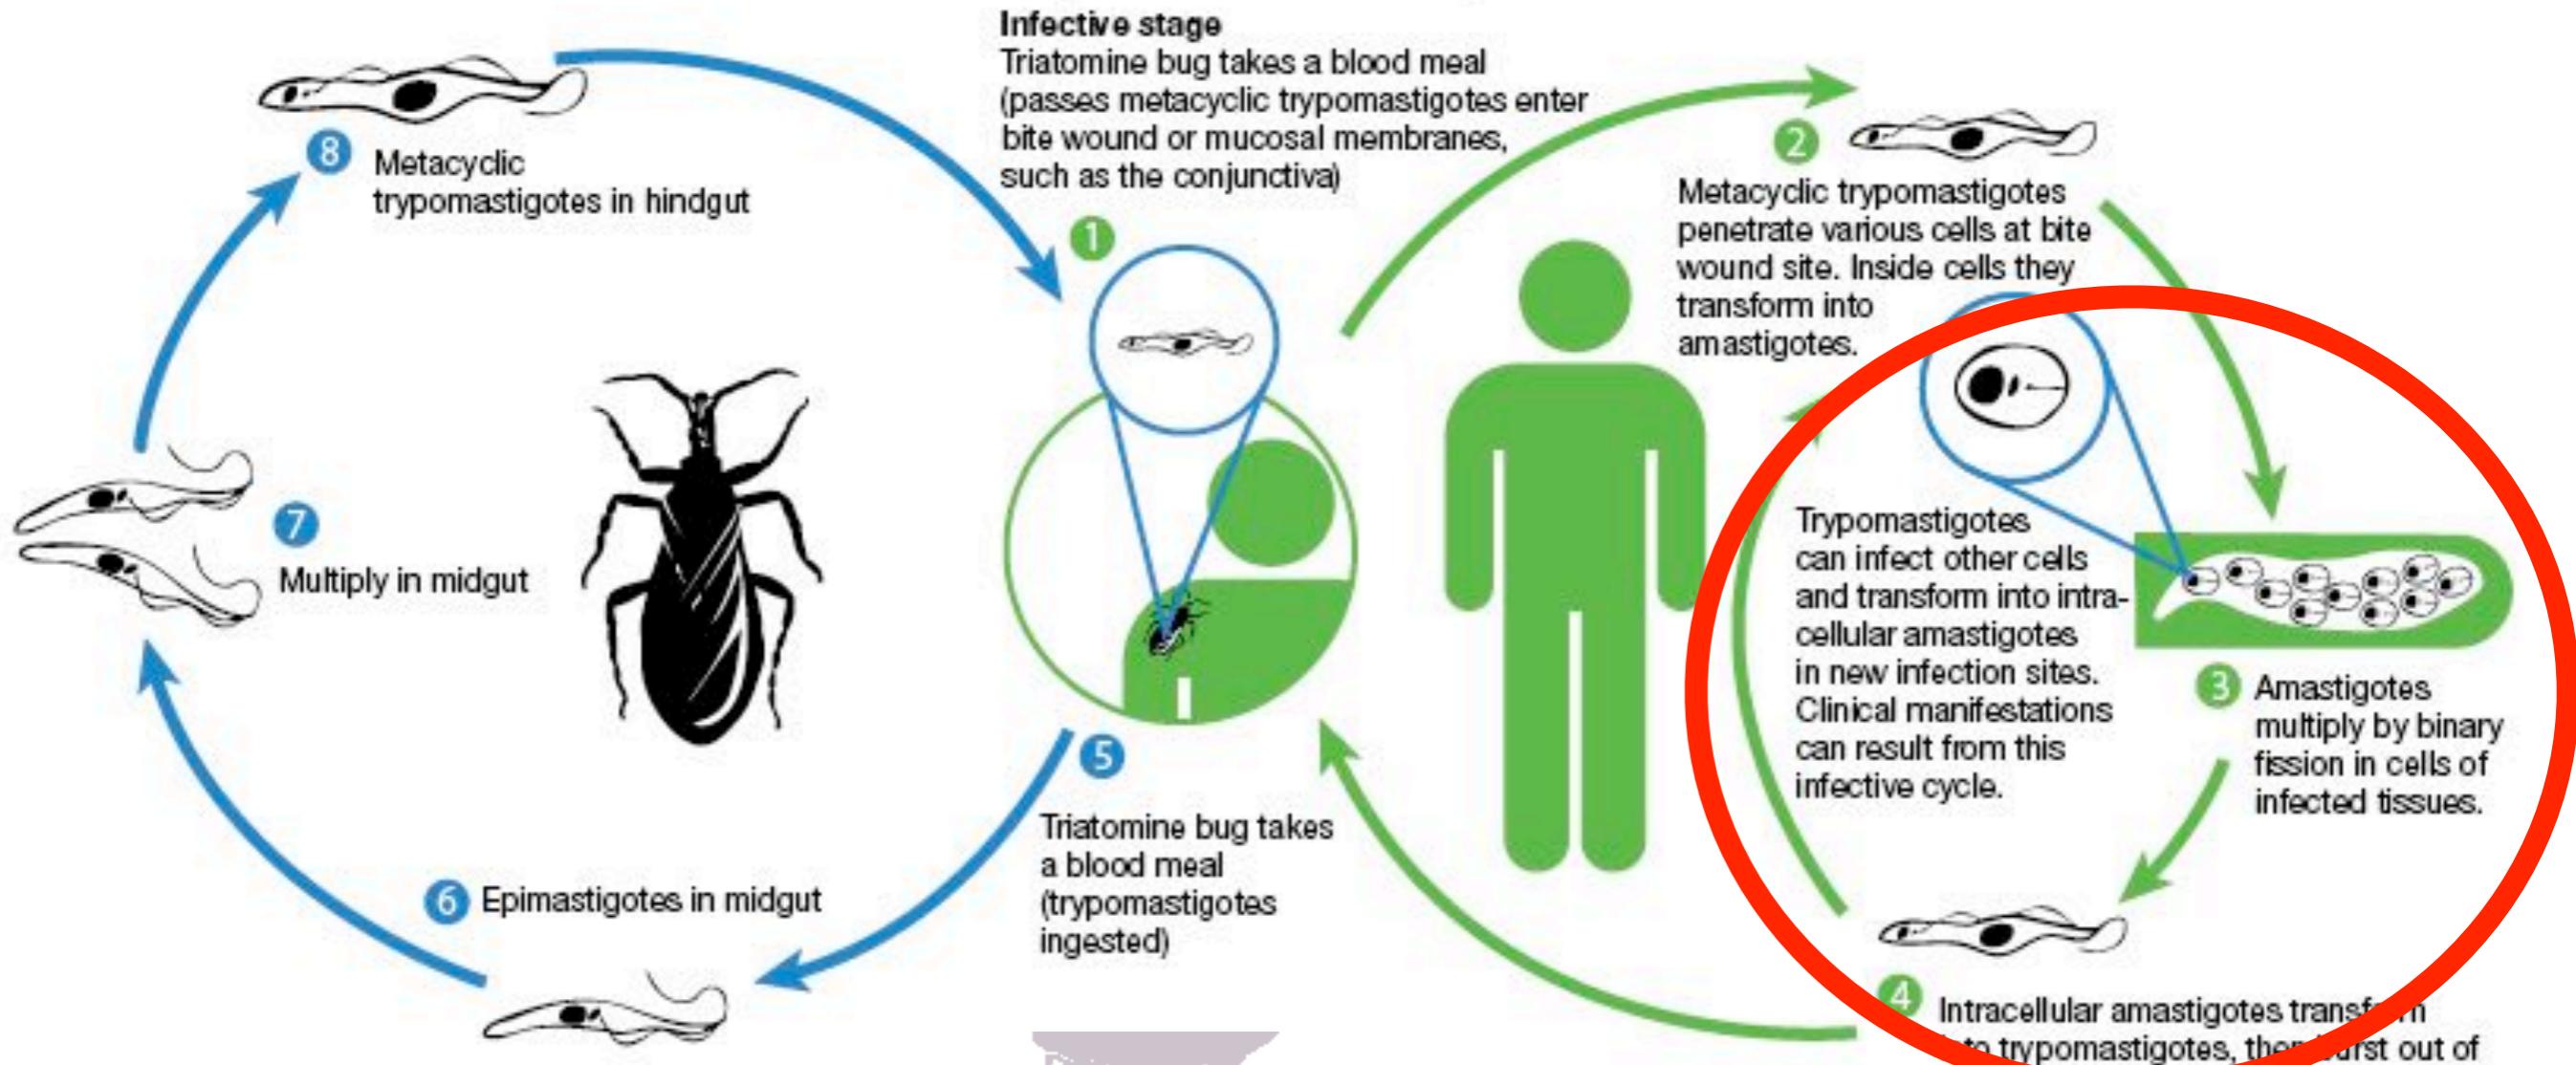

# IMAGE PROCESSING: TISSUE DEVELOPMENT

▶ How cells migrate over other cells?

# IMAGE PROCESSING: CHAGAS

## Infection cycles of Chagas disease

Trypomastigoten = mobile pathogen

Amastigoten = immobile pathogen

Epimastigoten = divisible pathogen

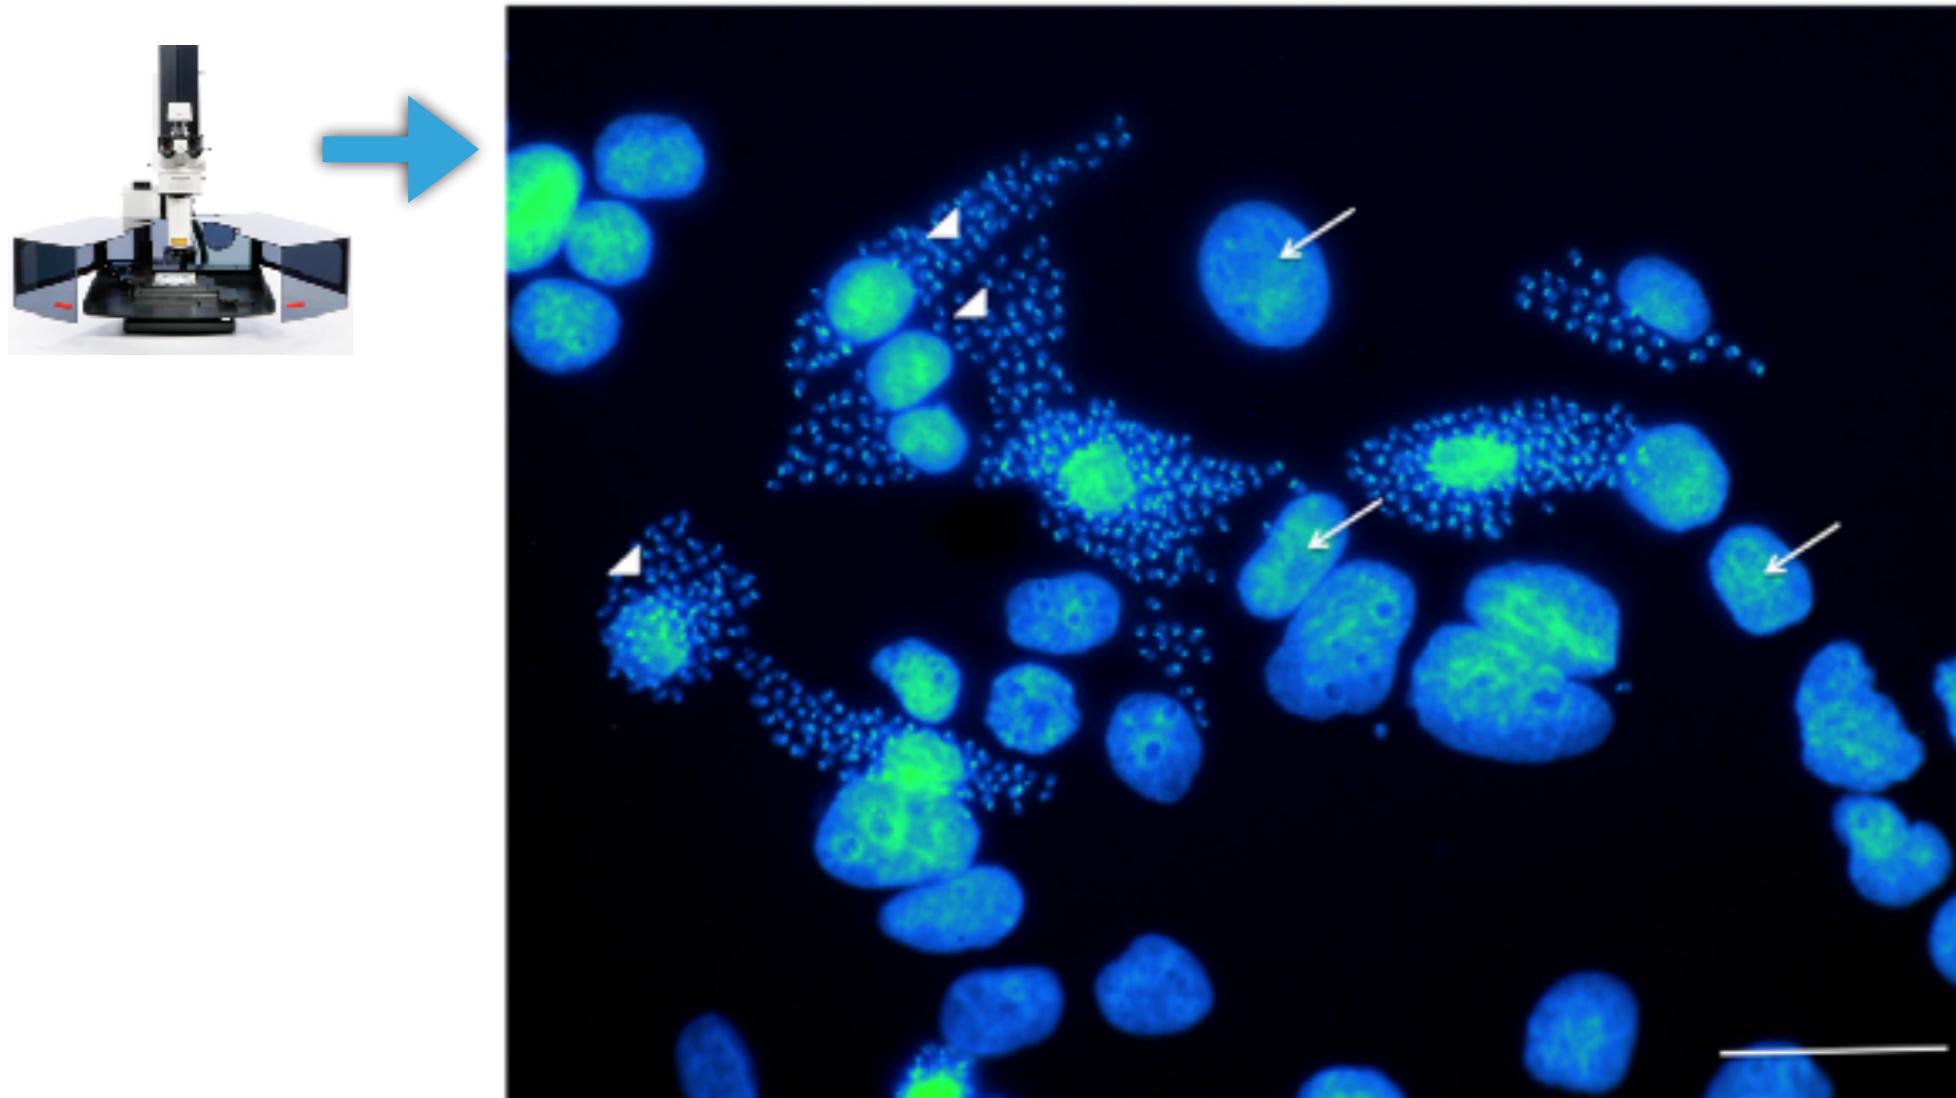

Source: [www.dpd-cdc.gov/dpdx](http://www.dpd-cdc.gov/dpdx)

A

## IMAGE PROCESSING: PARASITES

---

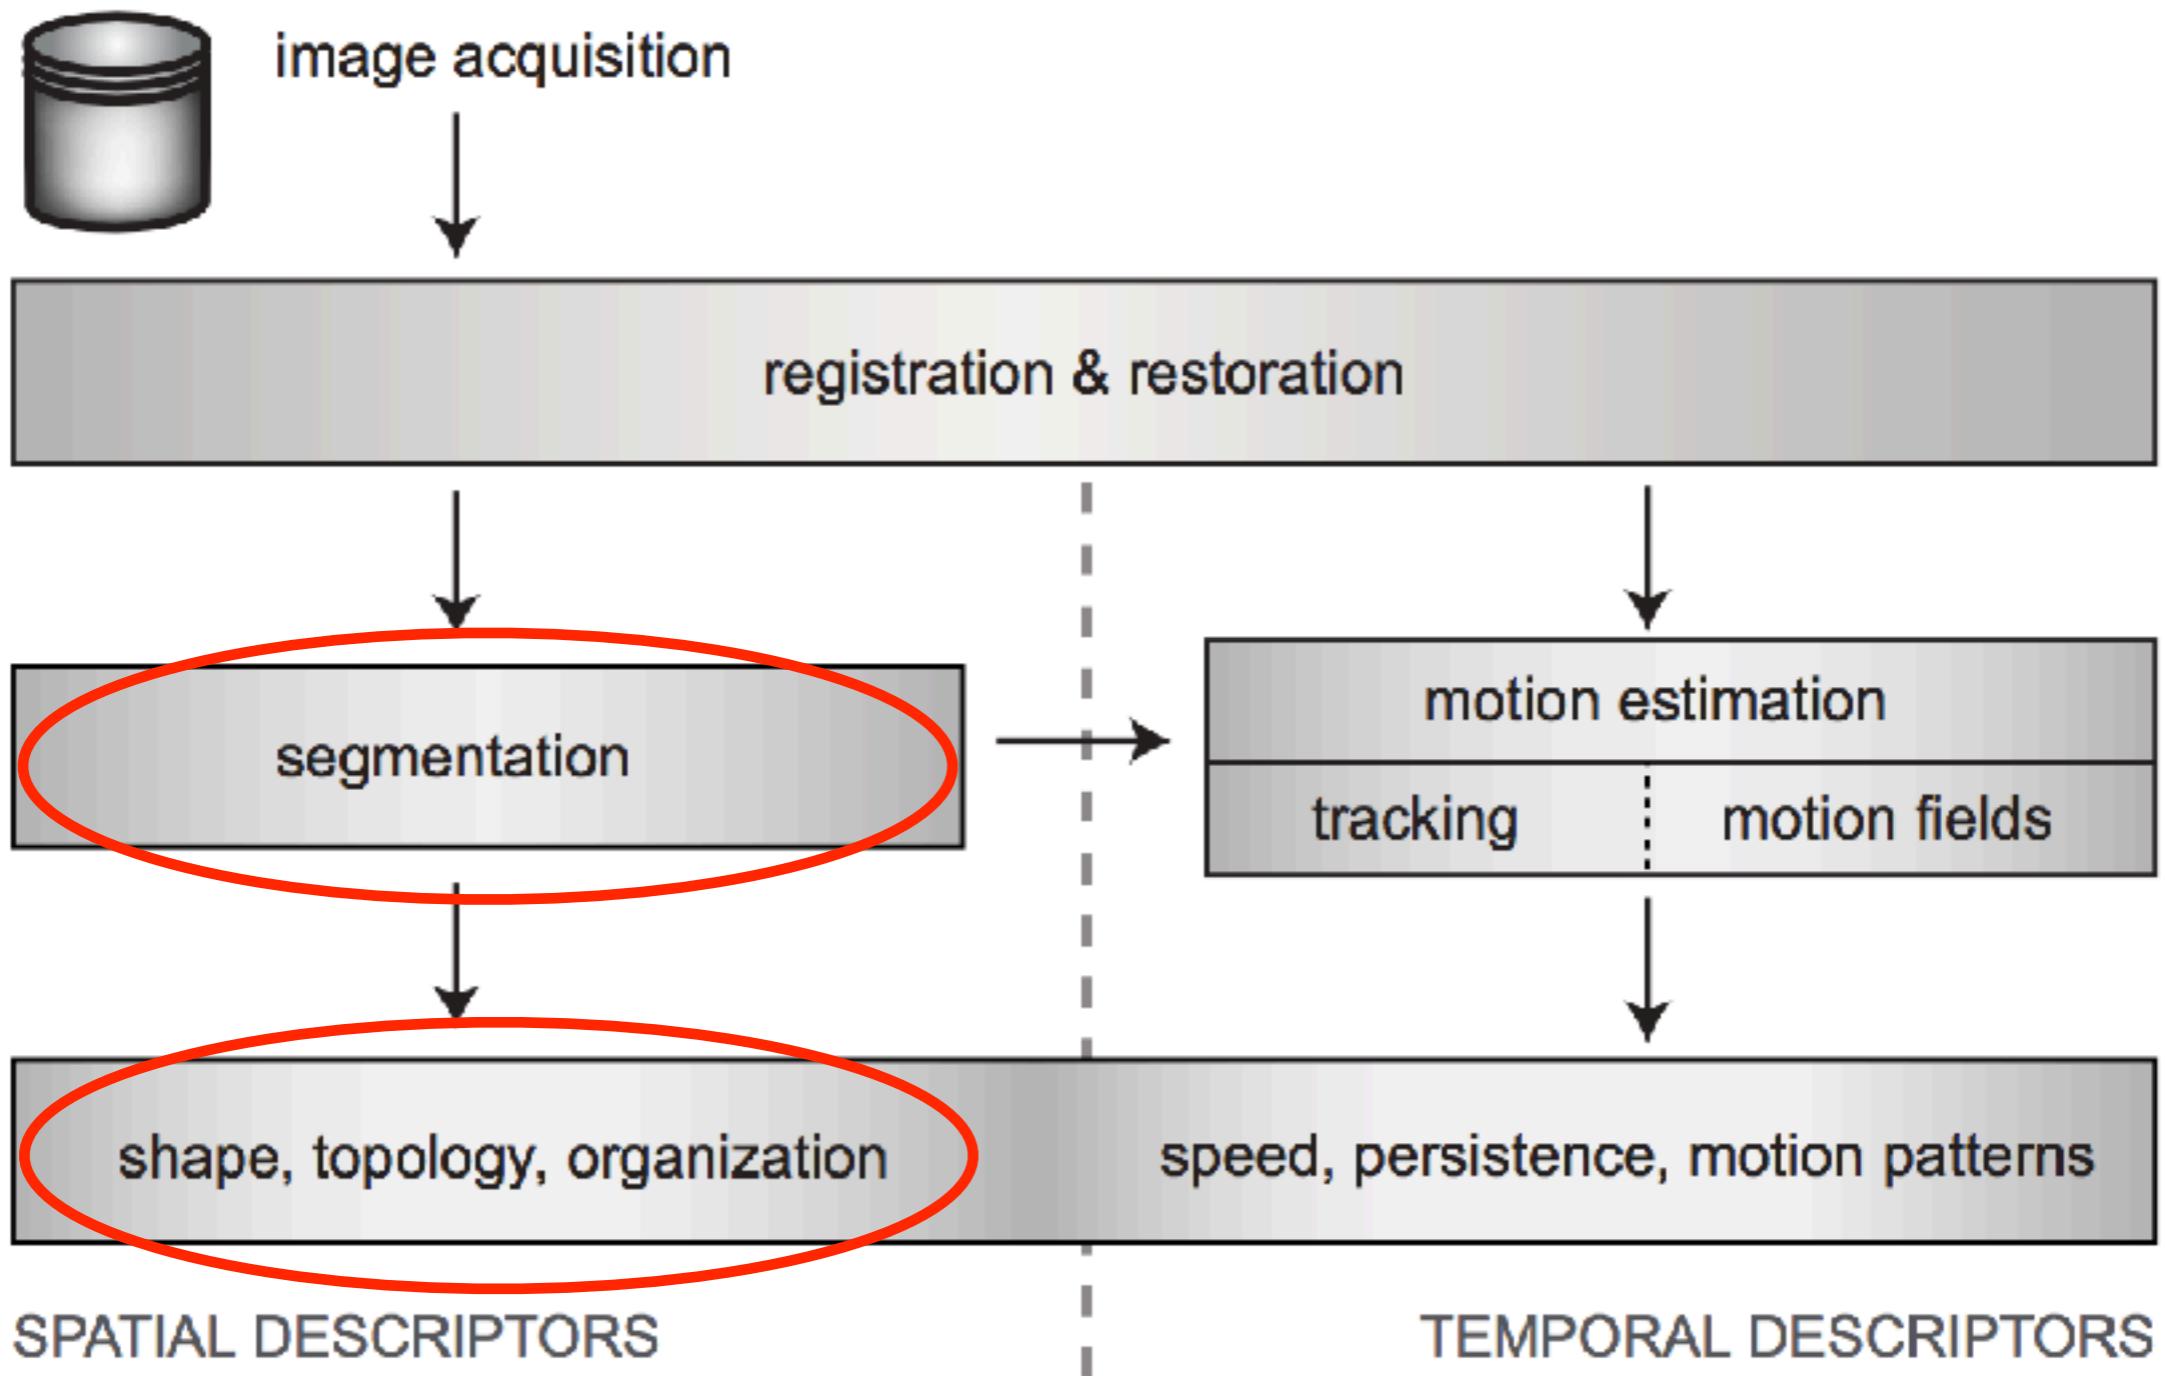

**Fig. 1.** Infection of BeWo cells with *T. cruzi* amastigotes. BeWo cells were challenged with *T. cruzi* Ypsilon strain trypomastigotes at a parasite:cell ratio of 1:1 for 24 h and were processed for DAPI staining after 48 h. The arrows show BeWo cell nuclei, and the arrowheads show intracellular amastigotes. Scale bar: 10  $\mu$ m.

► Pregnancy?

# IMAGE PROCESSING: PIPELINE

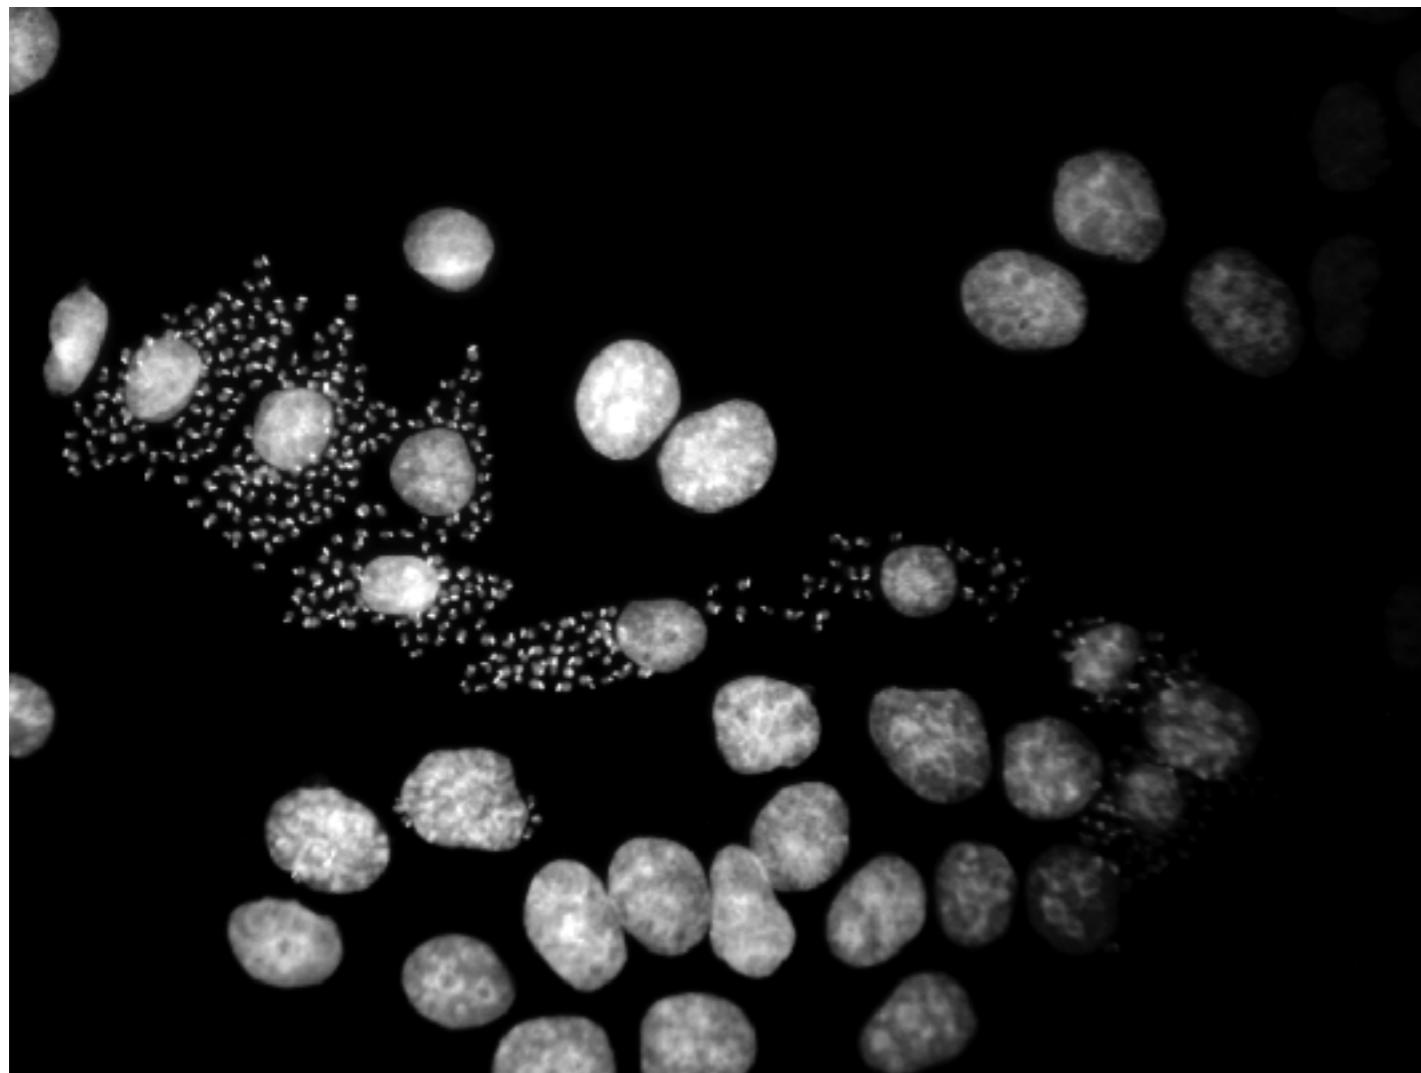

---

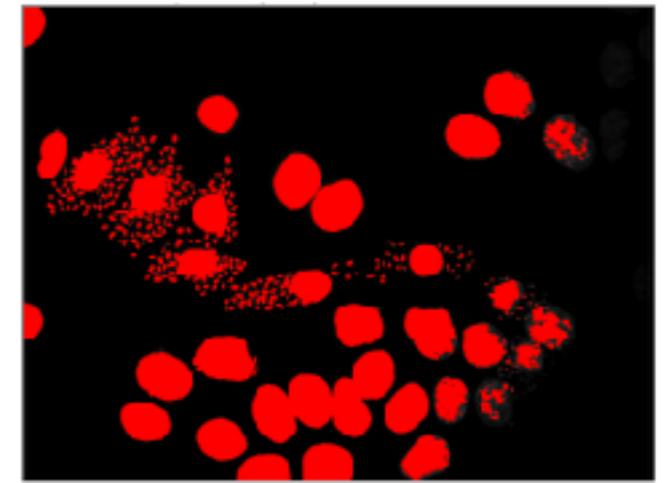

## IMAGE SEGMENTATION

---

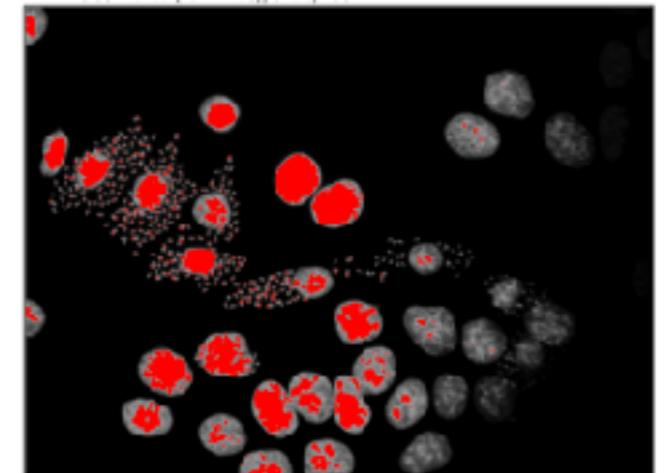

- ▶ The simplest segmentation... a manual global threshold [demo FIJI].

raw image

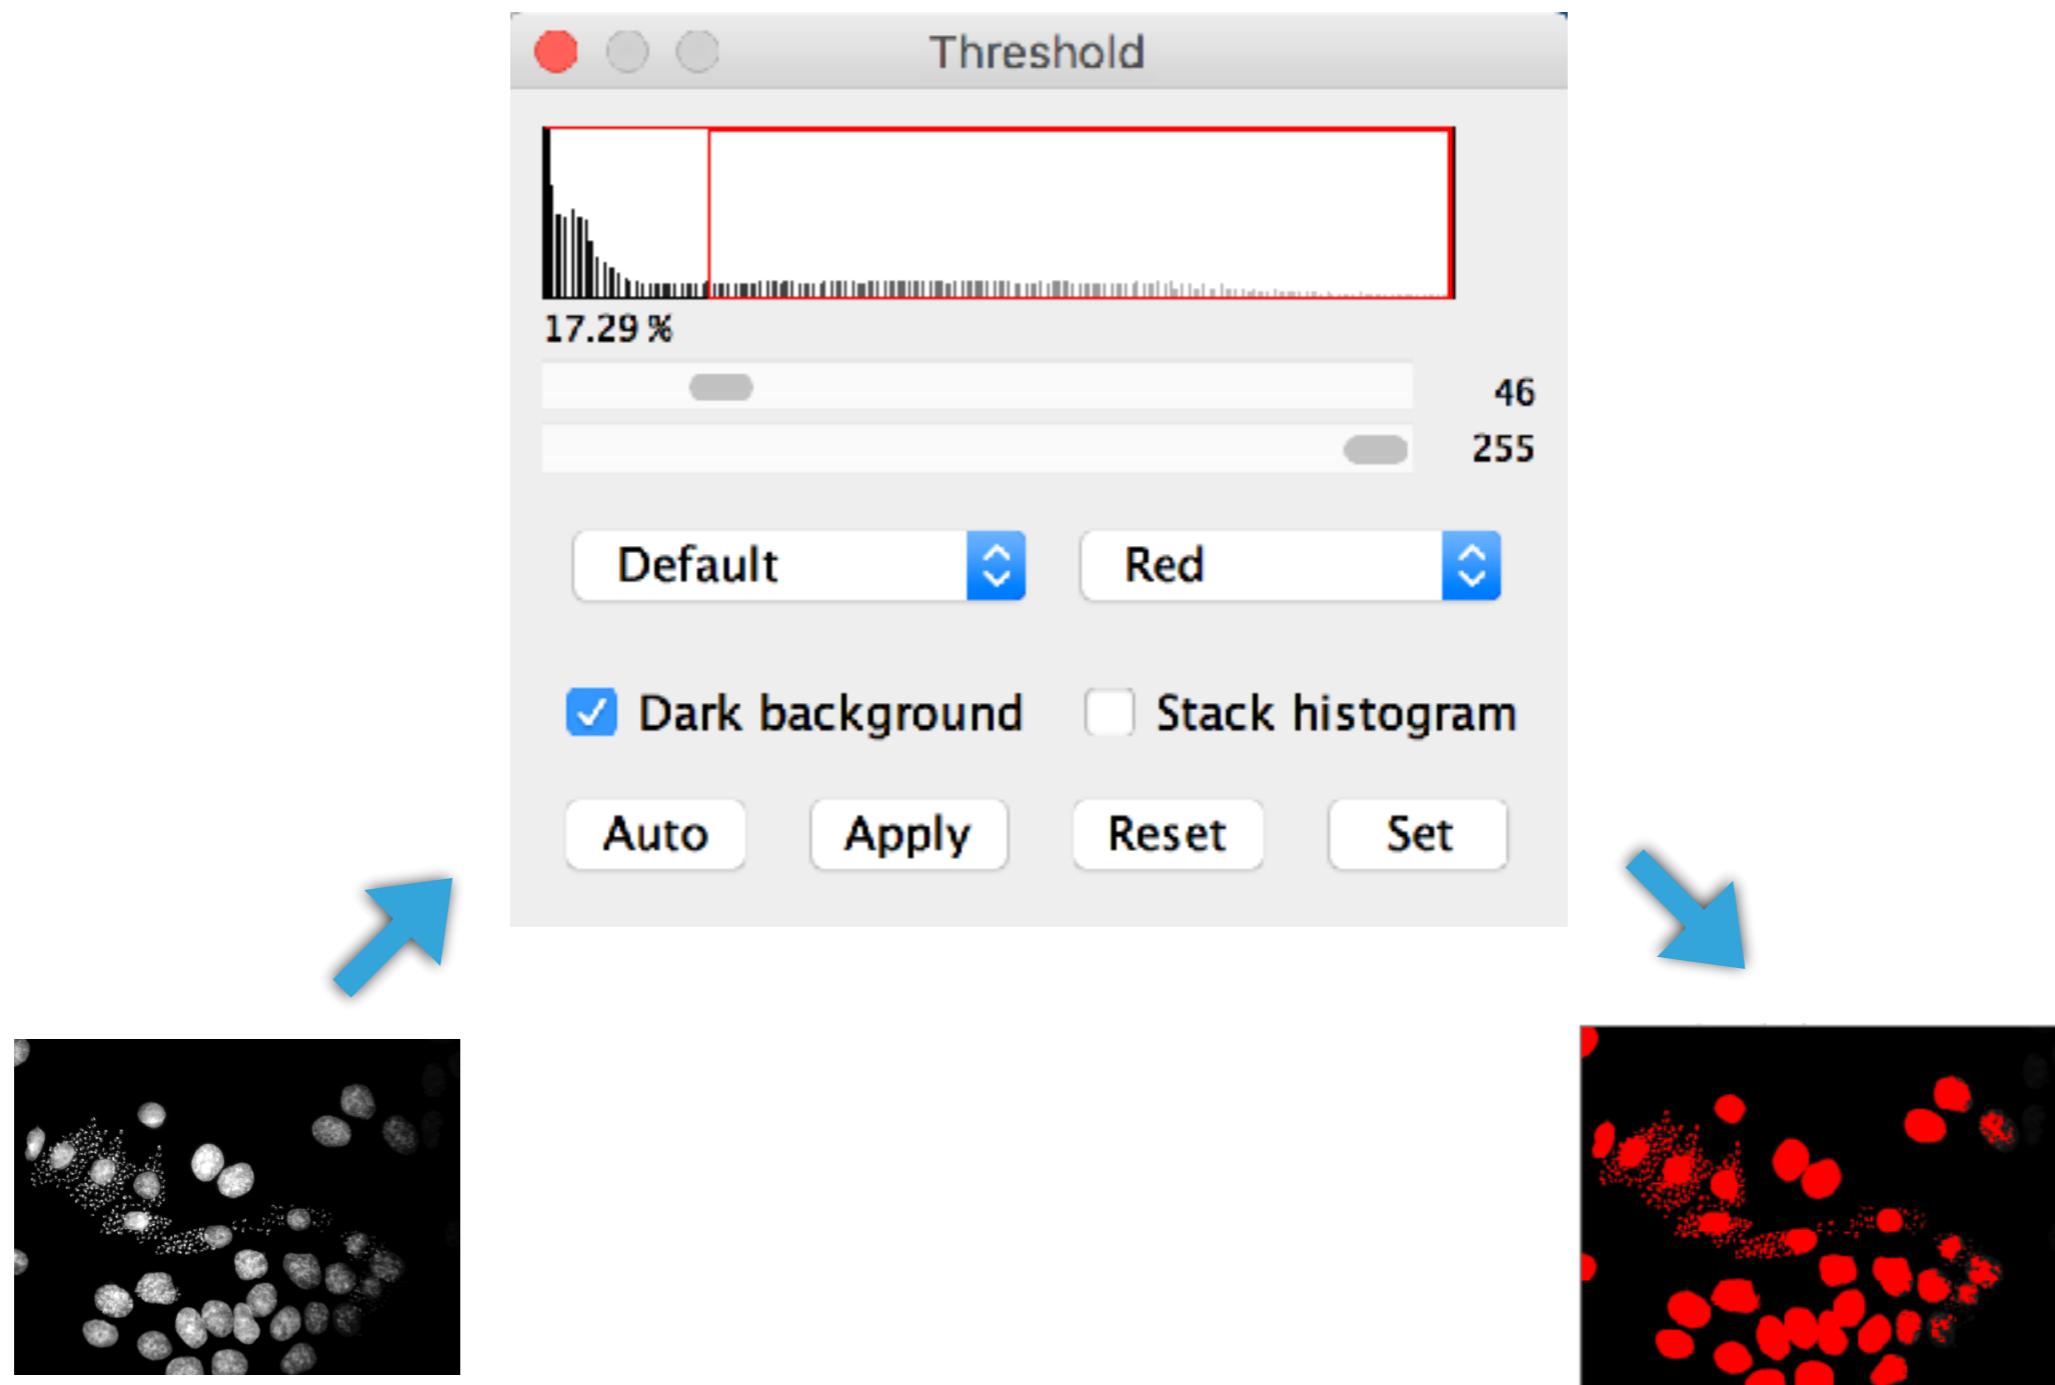

segmentation ( $>46$ )

segmentation ( $>158$ )

# IMAGE SEGMENTATION

► But, it looks like ? ...

## IMAGE SEGMENTATION

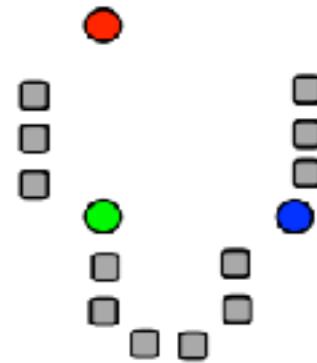

---

- ▶ We will start with two objects: cells, and background.
- ▶ We don't have examples (!)
- ▶ This is another kind of learning problem:
  - ▶ Supervised: regression, classification
  - ▶ Unsupervised: **clustering**

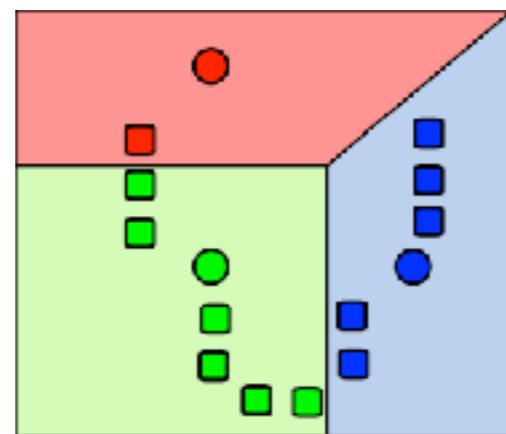

## IMAGE SEGMENTATION

---

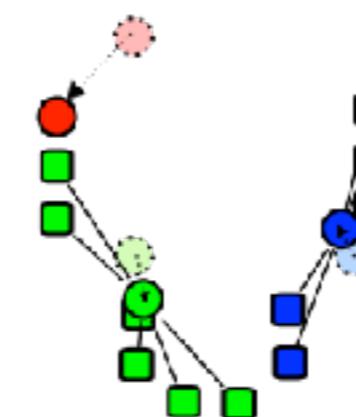

- ▶ We can model it as how to discover the best  $k$  groups or clusters at a pixel level.
- ▶ K-means clustering ( $k=3$ ):

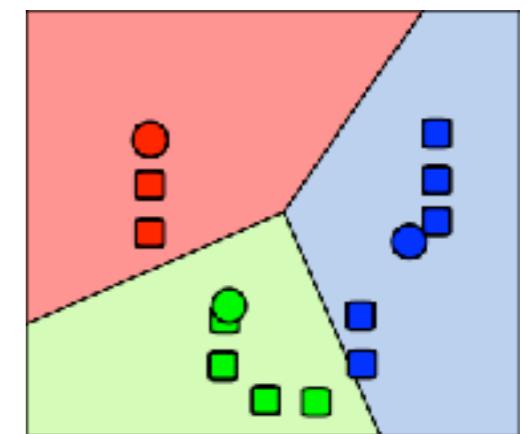

Random centroids

clusters assignation +  
voronoi diagram

centroids re-computation

cluster assignation +  
voronoi diagram

- ▶ K-Mean pseudocode [demo FIJI]:

## IMAGE SEGMENTATION

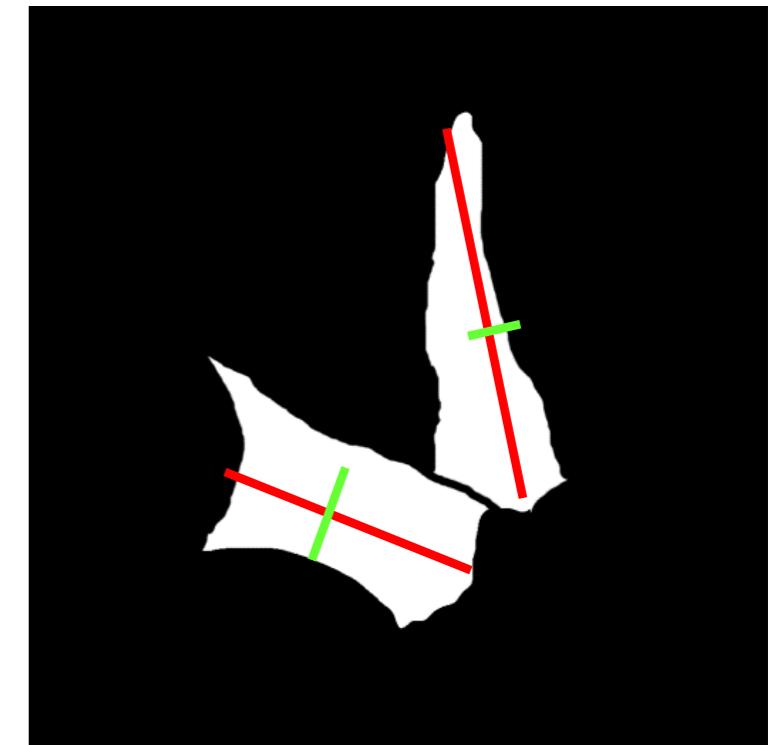

---

- ▶ But we can also make examples! (label data)
- ▶ In that case, segmentation may be a supervised problem.  
Let's try to solve it as a Random Forest problem [demo FIJI].
- ▶ How can we decide?

## SHAPE DESCRIPTION: MOTIVATION

---

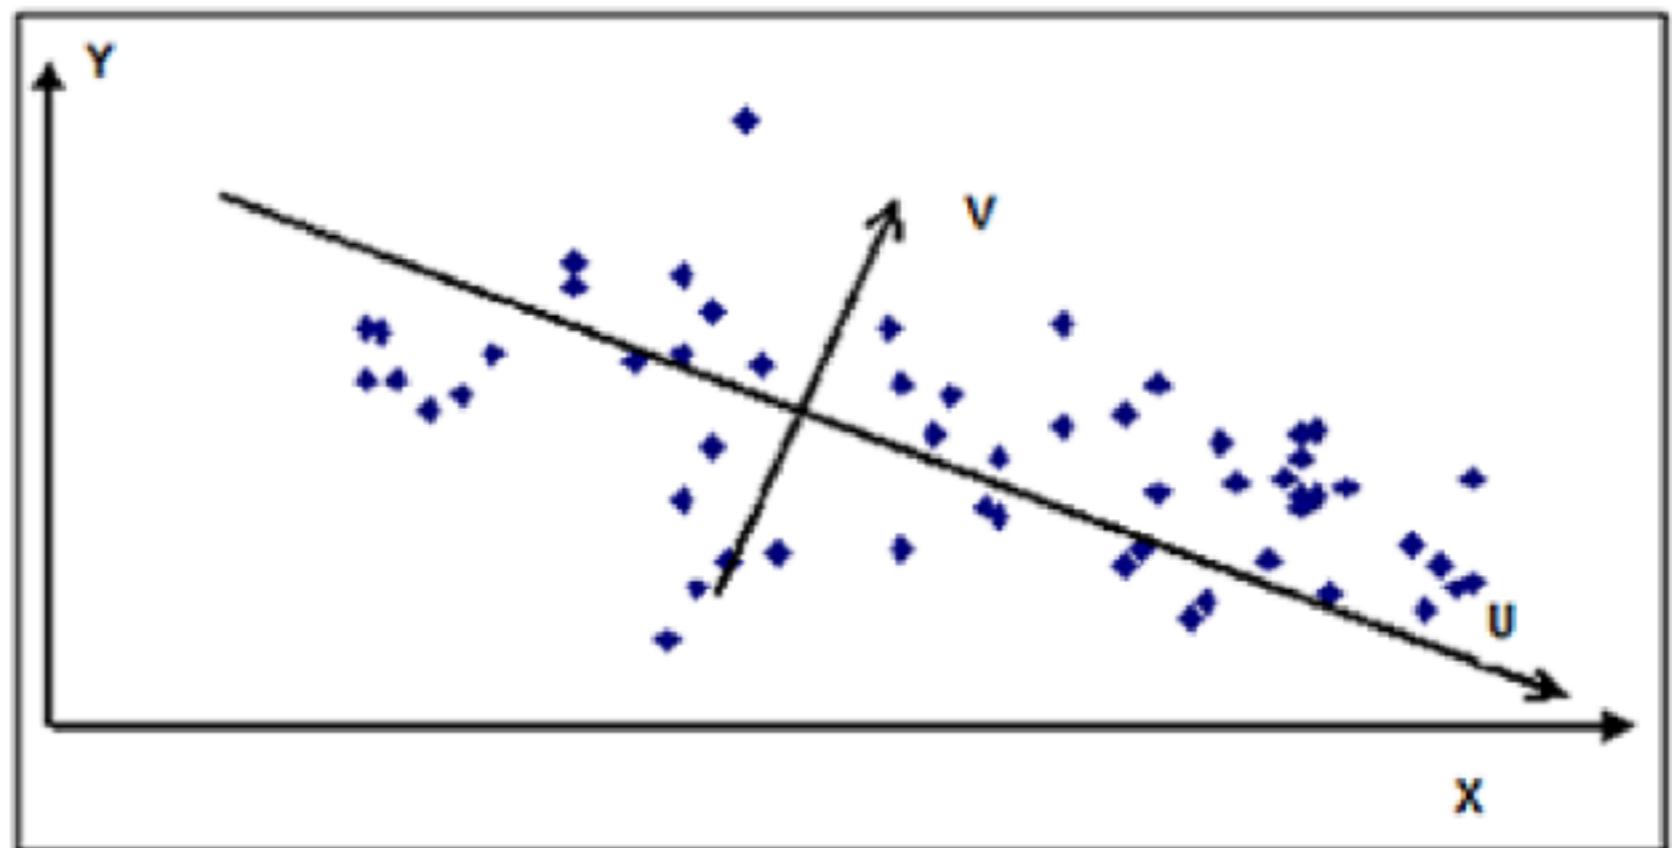

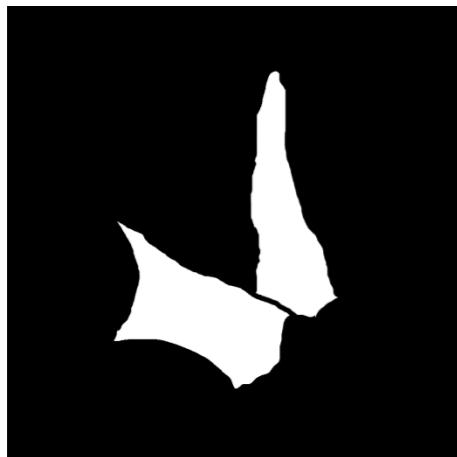

- ▶ If images are segmented, we can easily count objects.
- ▶ But, we cannot tell the difference between small and big or circle-like vs elongated cells.

## SHAPE DESCRIPTION: IMAGE AS DISTRIBUTION

---

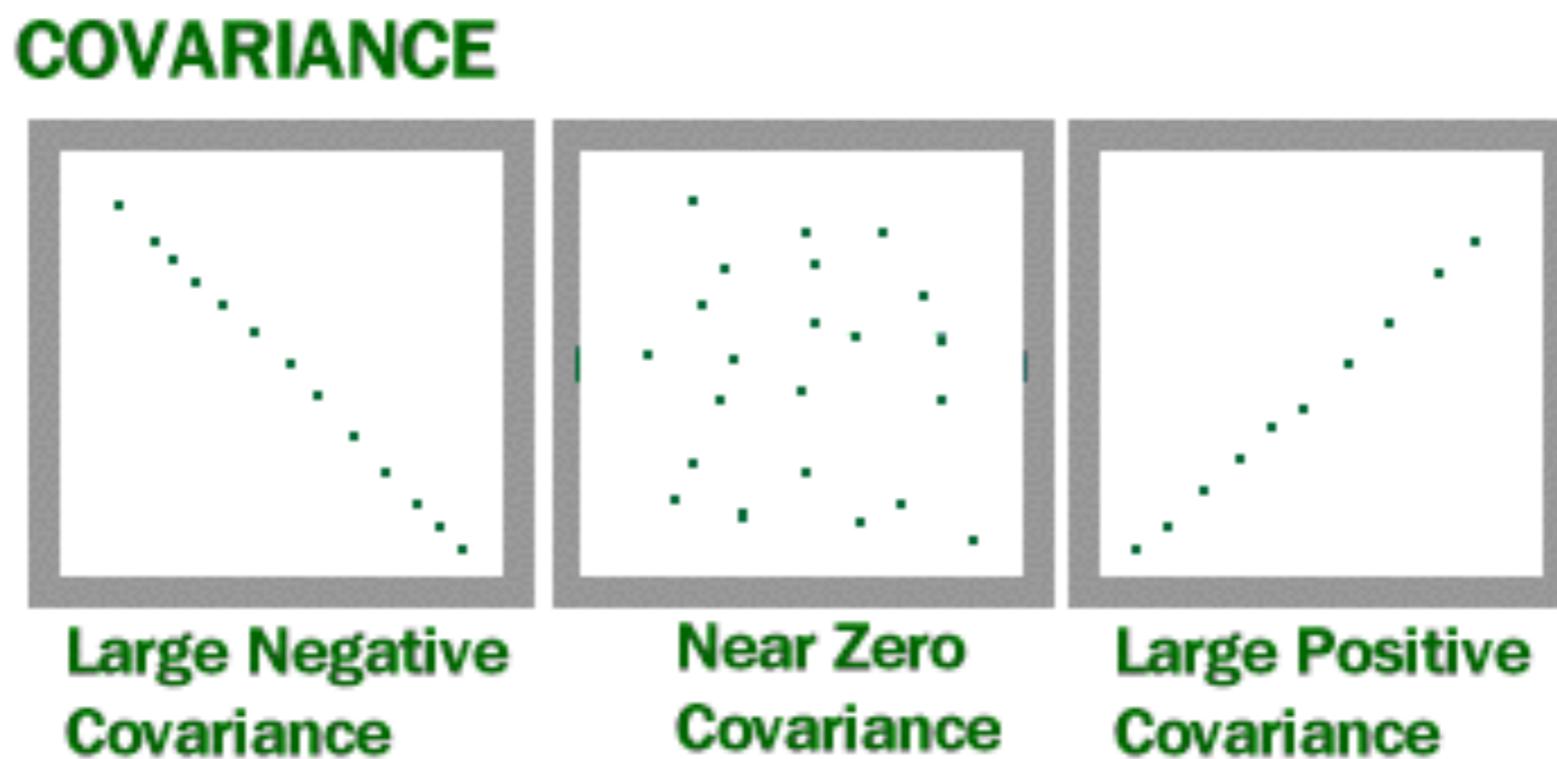

- ▶ The image as a set of pixels
- ▶ We can always find a direction to maximize variance

## SHAPE DESCRIPTION: IMAGE AS DISTRIBUTION

---

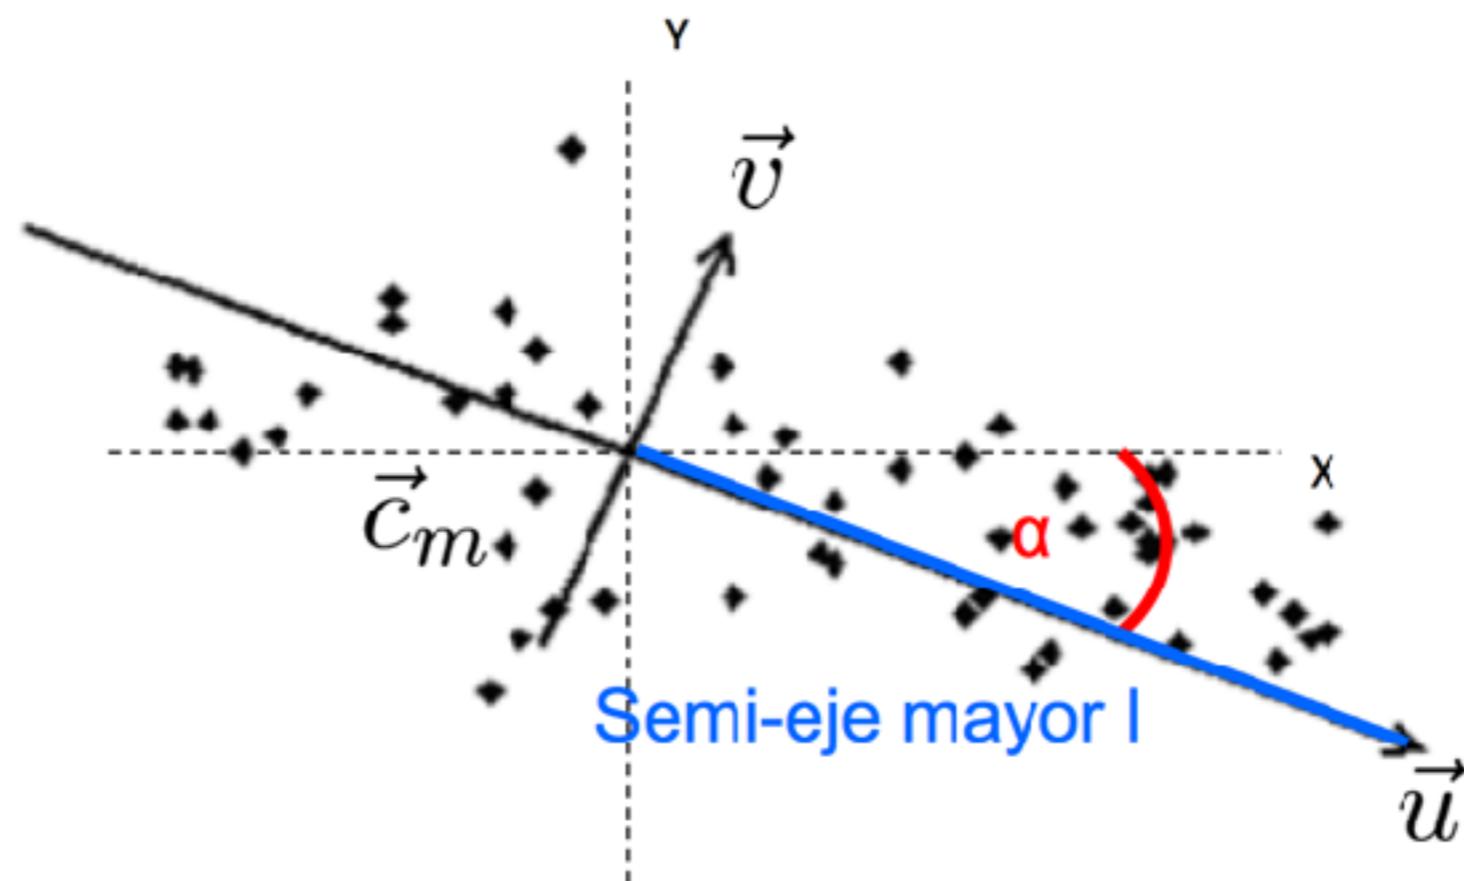

- ▶ We can always find a direction to maximize variance
- ▶ Equivalent to diagonalize covariance matrix

## SHAPE DESCRIPTION: GEOMETRICAL VIEW

---

- ▶ We look for a rotation where covariance matrix is diagonal.

## SHAPE DESCRIPTION: GEOMETRICAL VIEW

---

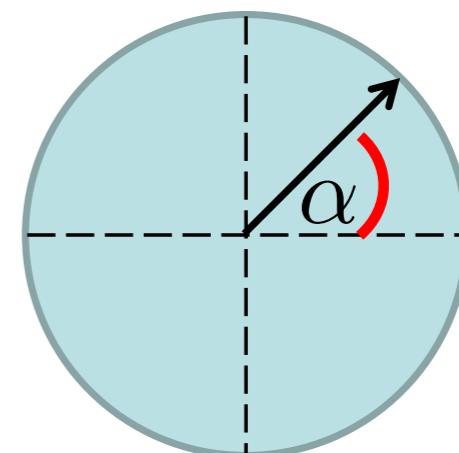

- ▶ If we call the rotation  $\alpha$
- ▶ Covariance matrix is diagonal (eigenvectors):

$$\sigma^2 \vec{u} = \lambda \vec{u} \quad \sigma^2 : \text{ covariance matrix}$$

- ▶ If we assume a size 1 vector

$$\cos(\alpha)^2 + \sin(\alpha)^2 = 1$$

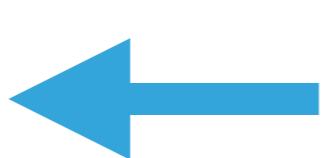

$$\hat{u} = \begin{pmatrix} a \\ b \end{pmatrix} = \begin{pmatrix} \cos(\alpha) \\ \sin(\alpha) \end{pmatrix}$$

## SHAPE DESCRIPTION: GEOMETRICAL VIEW

---

$$\sigma^2 \vec{u} = \lambda \vec{u}$$

$$\vec{u} = \begin{pmatrix} a \\ b \end{pmatrix} = \begin{pmatrix} \cos(\alpha) \\ \sin(\alpha) \end{pmatrix}$$

$$\begin{pmatrix} (\sigma_{xx}^2 - \lambda) \cos(\alpha) + \sigma_{xy}^2 \sin(\alpha) \\ \sigma_{xy}^2 \cos(\alpha) + (\sigma_{yy}^2 - \lambda) \sin(\alpha) \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$$

$$\alpha = \frac{1}{2} \arctan \left( \frac{2\mu_{1,1}}{\mu_{2,0} - \mu_{0,2}} \right)$$

## SHAPE DESCRIPTION: GEOMETRICAL VIEW

---

- ▶ With 1st eigenvalue we can measure the “length” ( $l$ ) of the object in its intrinsic shape.

$$l^2 = \lambda = \frac{Tr(\sigma^2)}{2} + \sqrt{\frac{T^2}{4} - \det(\sigma^2)}$$

$$l^2 = \lambda = \frac{1}{2} \left( \sigma_{xx}^2 + \sigma_{yy}^2 + \sqrt{(\sigma_{xx}^2 - \sigma_{yy}^2)^2 + 4(\sigma_{xy}^2)^2} \right)$$

## SHAPE DESCRIPTION: ECCENTRICITY

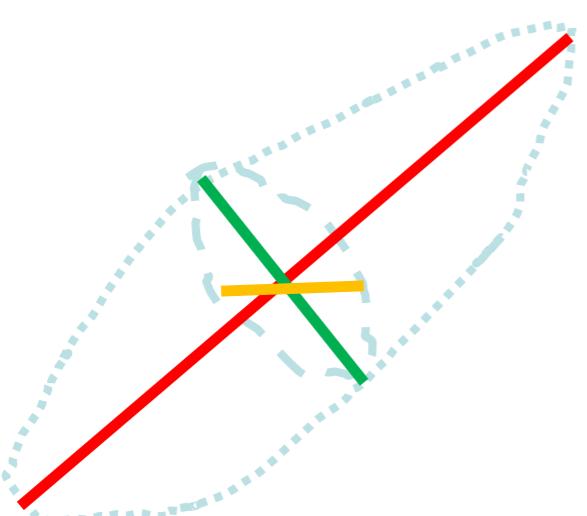

---

- We can now define eccentricity as:

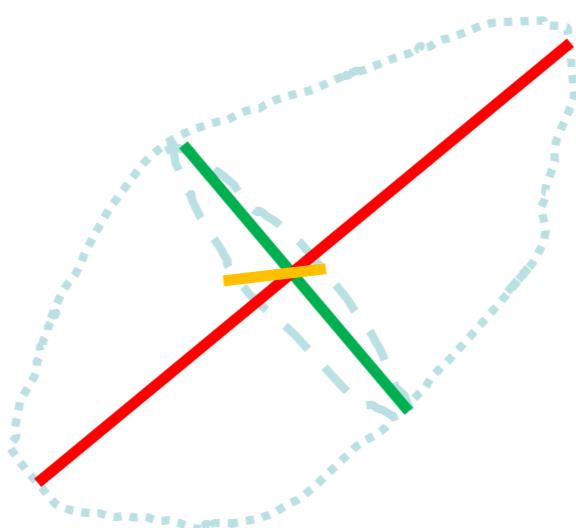

$$Elong = 1 - \frac{\lambda_2}{\lambda_1}$$

$$R.Elong = 1 - \frac{\lambda_3}{\lambda_1}$$

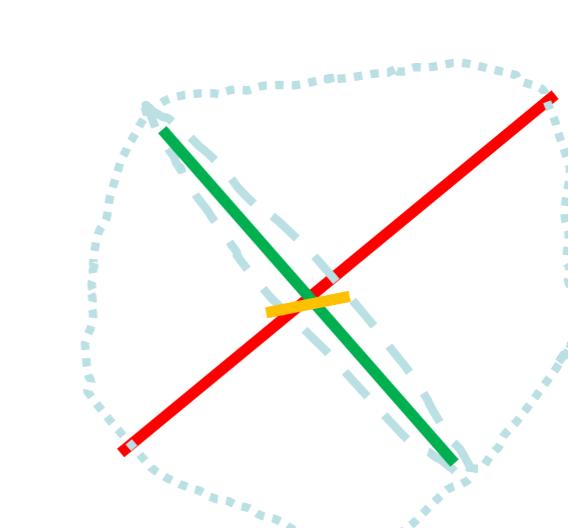

$$Flatness = 1 - \frac{\lambda_3}{\lambda_2}$$

$\lambda_1 \gg \lambda_2$   
Elong.  $\sim 1$

$\lambda_1 \gg \lambda_3$   
R. Elong.  $\sim 1$

$\lambda_2 \gg \lambda_3$   
Flatn.  $\sim 1$

## SHAPE DESCRIPTION: FAST COMPUTATION

---

- ▶ We can compute it fast in binary images with image moments.

$$m_{p,q} = \sum x^p y^q I(x, y) \quad \mu_{p,q} = \sum (x - \bar{x})^p (y - \bar{y})^q I(x, y)$$

**Order 0**

$$m_{0,0} = \sum I(x, y)$$

$$\text{area} = m_{0,0}$$

**Order 1**

$$m_{1,0} = \sum x I(x, y)$$

$$m_{0,1} = \sum y I(x, y)$$

$$\vec{c}_m = \left( \frac{m_{1,0}}{m_{0,0}}, \frac{m_{0,1}}{m_{0,0}} \right)$$

## SHAPE DESCRIPTION: FAST COMPUTATION

---

- With 2nd order moments covariance matrix is:

$$\sigma_x^2 = \frac{\sum(x-\bar{x})^2}{N} = \frac{\mu_{2,0}}{\mu_{0,0}} \quad \sigma_{xy}^2 = \frac{\sum(x-\bar{x})(y-\bar{y})}{N} = \frac{\mu_{1,1}}{\mu_{0,0}}$$

$$\sigma^2 = \frac{1}{\mu_{0,0}} \begin{bmatrix} \mu_{2,0} & \mu_{1,1} \\ \mu_{1,1} & \mu_{0,2} \end{bmatrix}$$

## SHAPE DESCRIPTION: PCA

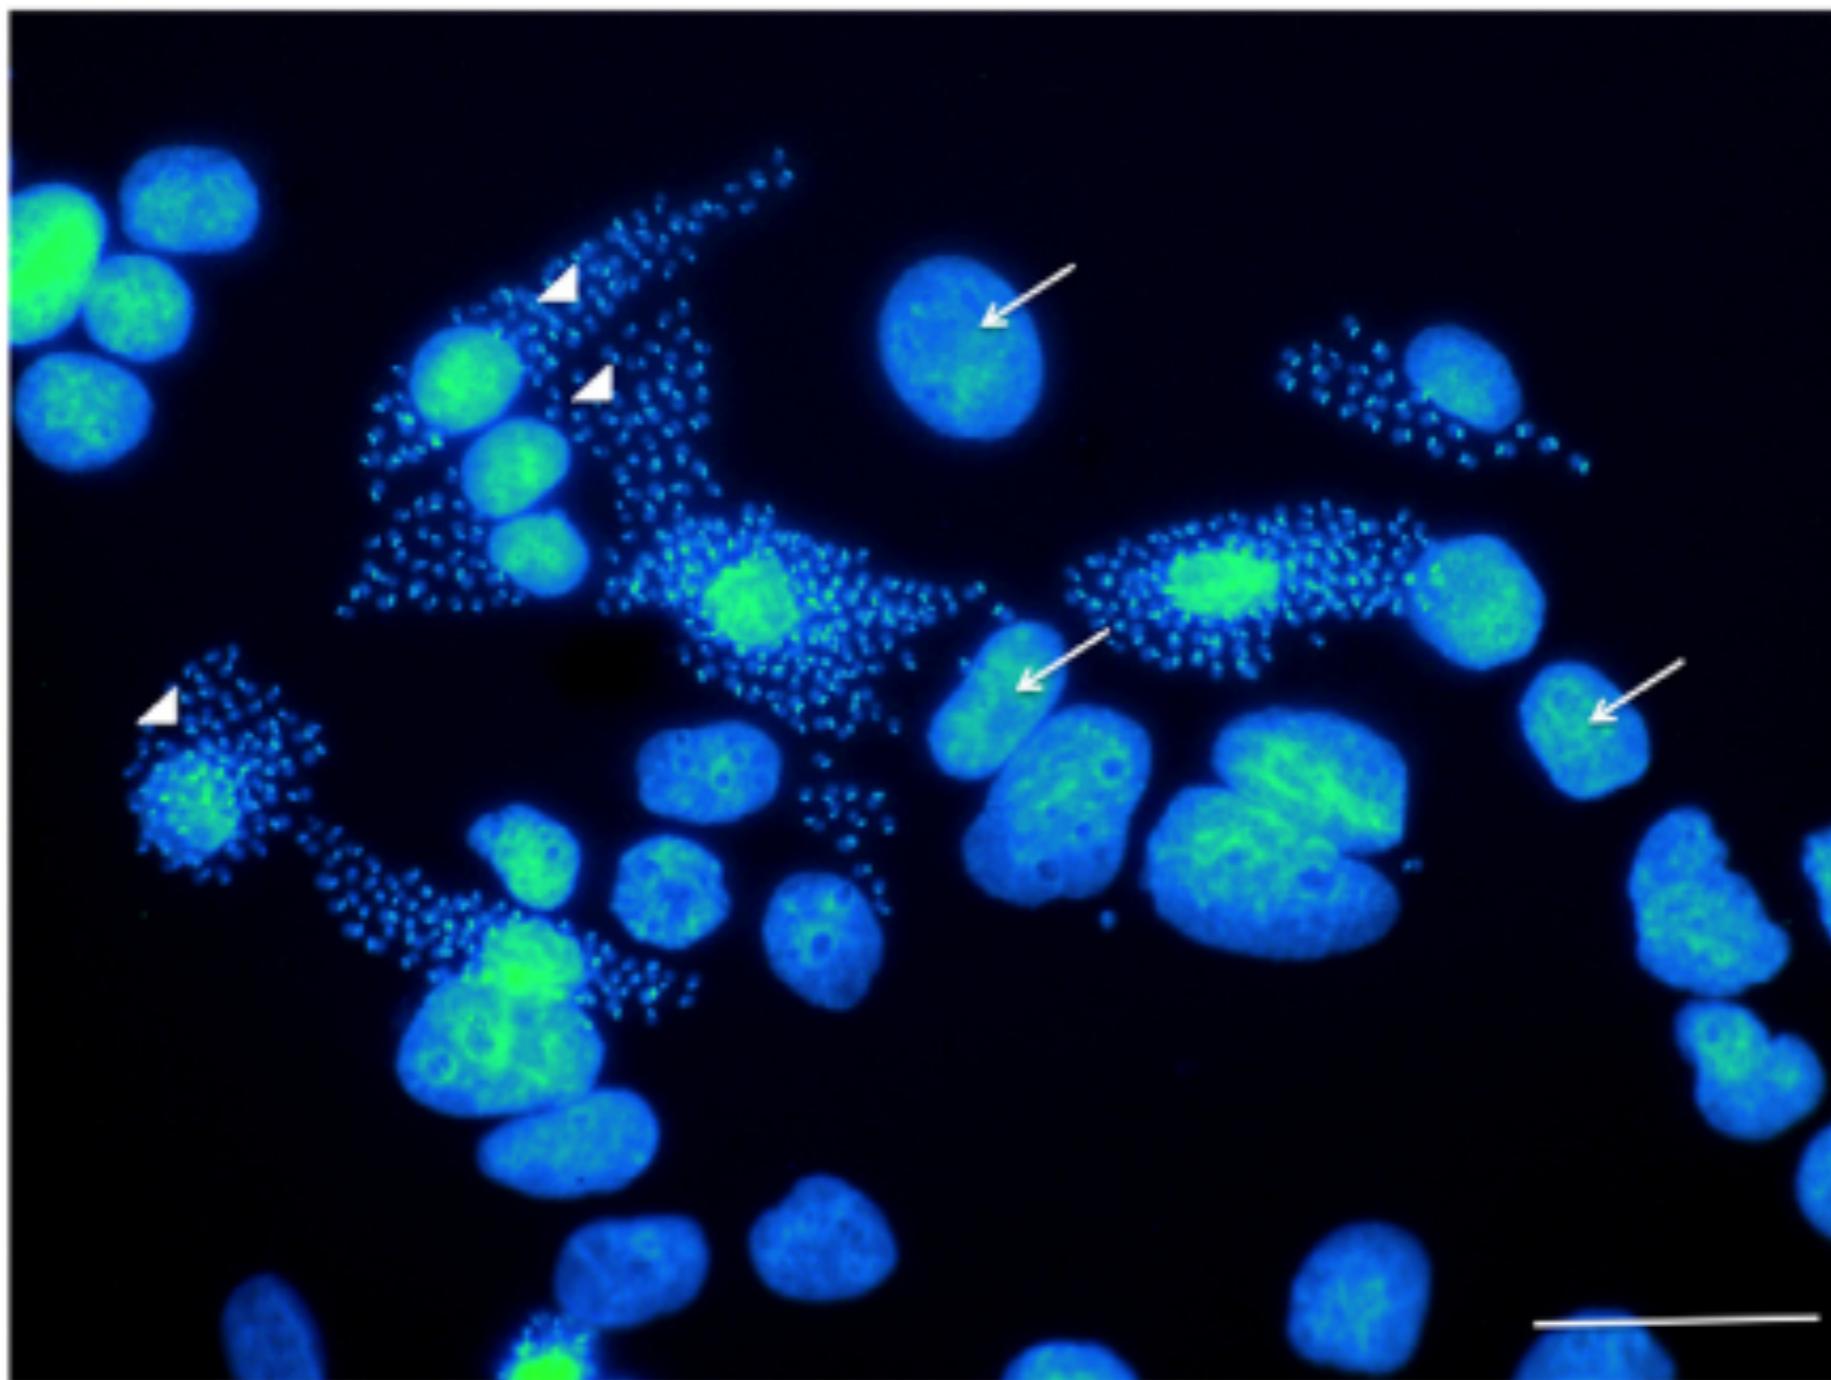

---

- ▶ To find the rotation is known as *Principal Component Analysis* (PCA).
- ▶ Multiple applications, eg. select eigenvectors to simplify distribution (objects) to a few numbers.
- ▶ PCA in FIJI [demo].

## LAB: CHALLENGE

---

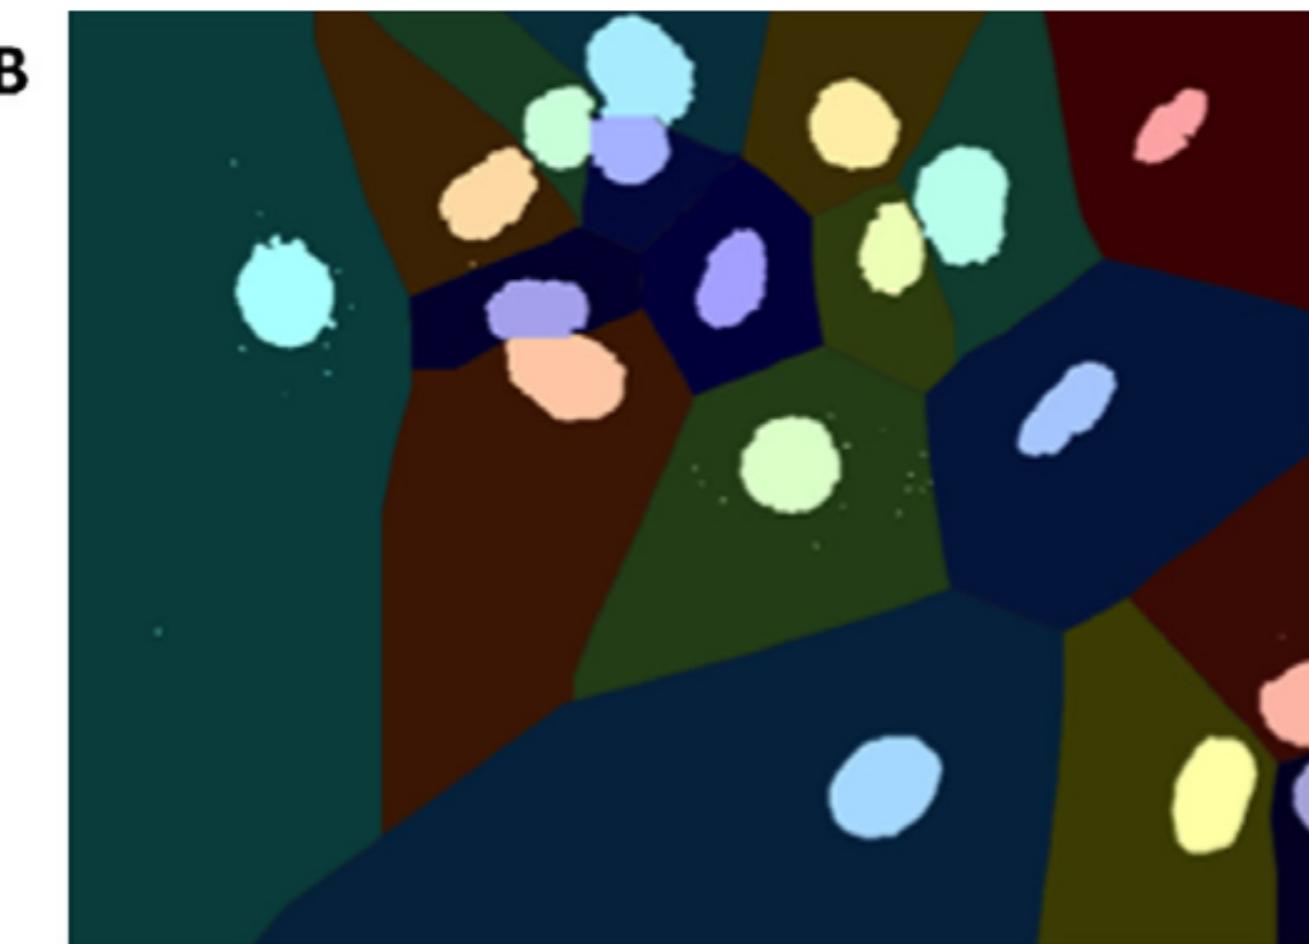

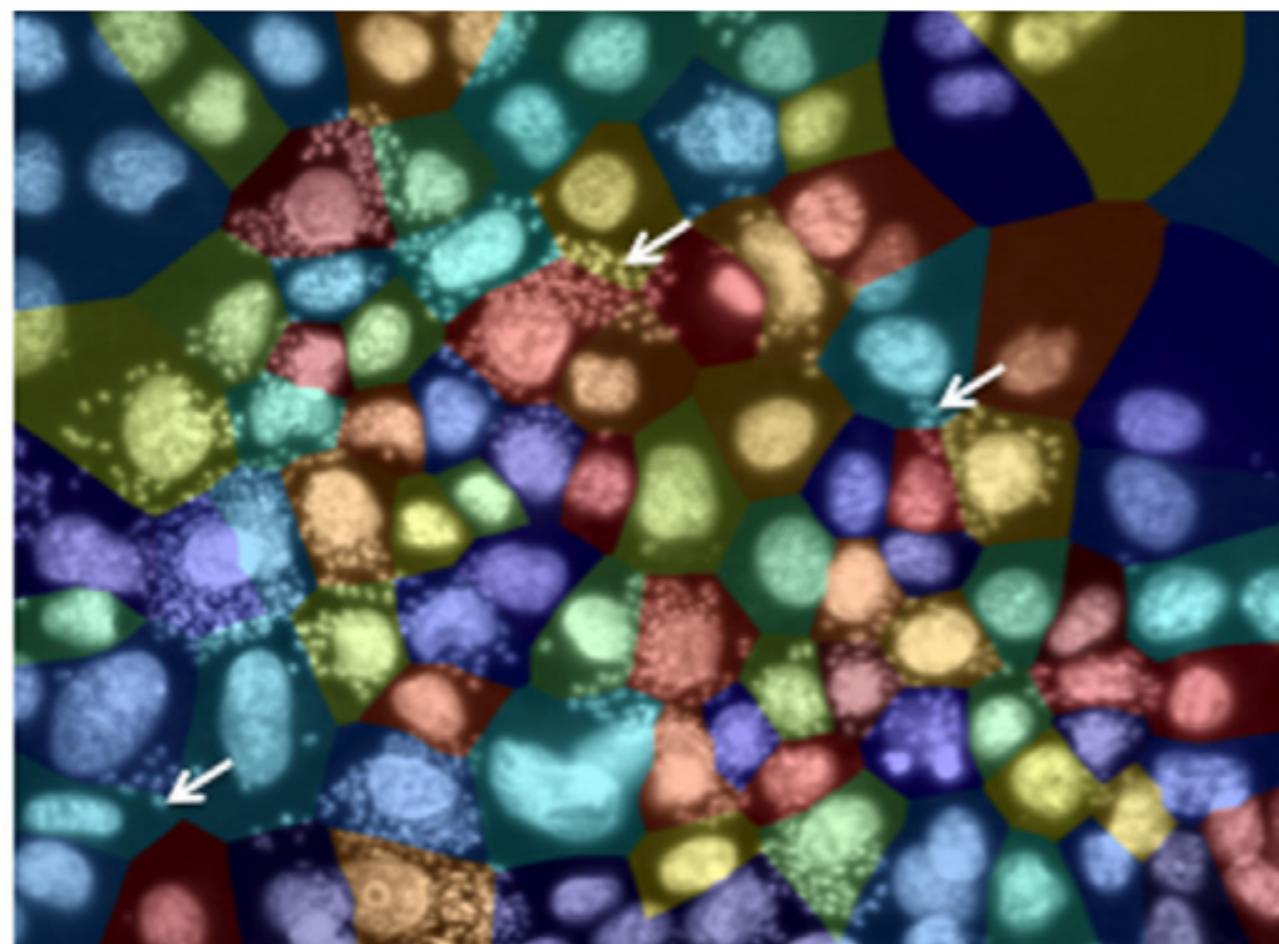

- ▶ Challenge 1: to estimate the number of parasites, BeWo cells, and their eccentricity.

## LAB: CHALLENGE

---

- ▶ Count the number of infected cells by assigning (eg Voronoi) parasites to BeWo cells.

## SHAPE DESCRIPTION: HIGH DIMENSION?

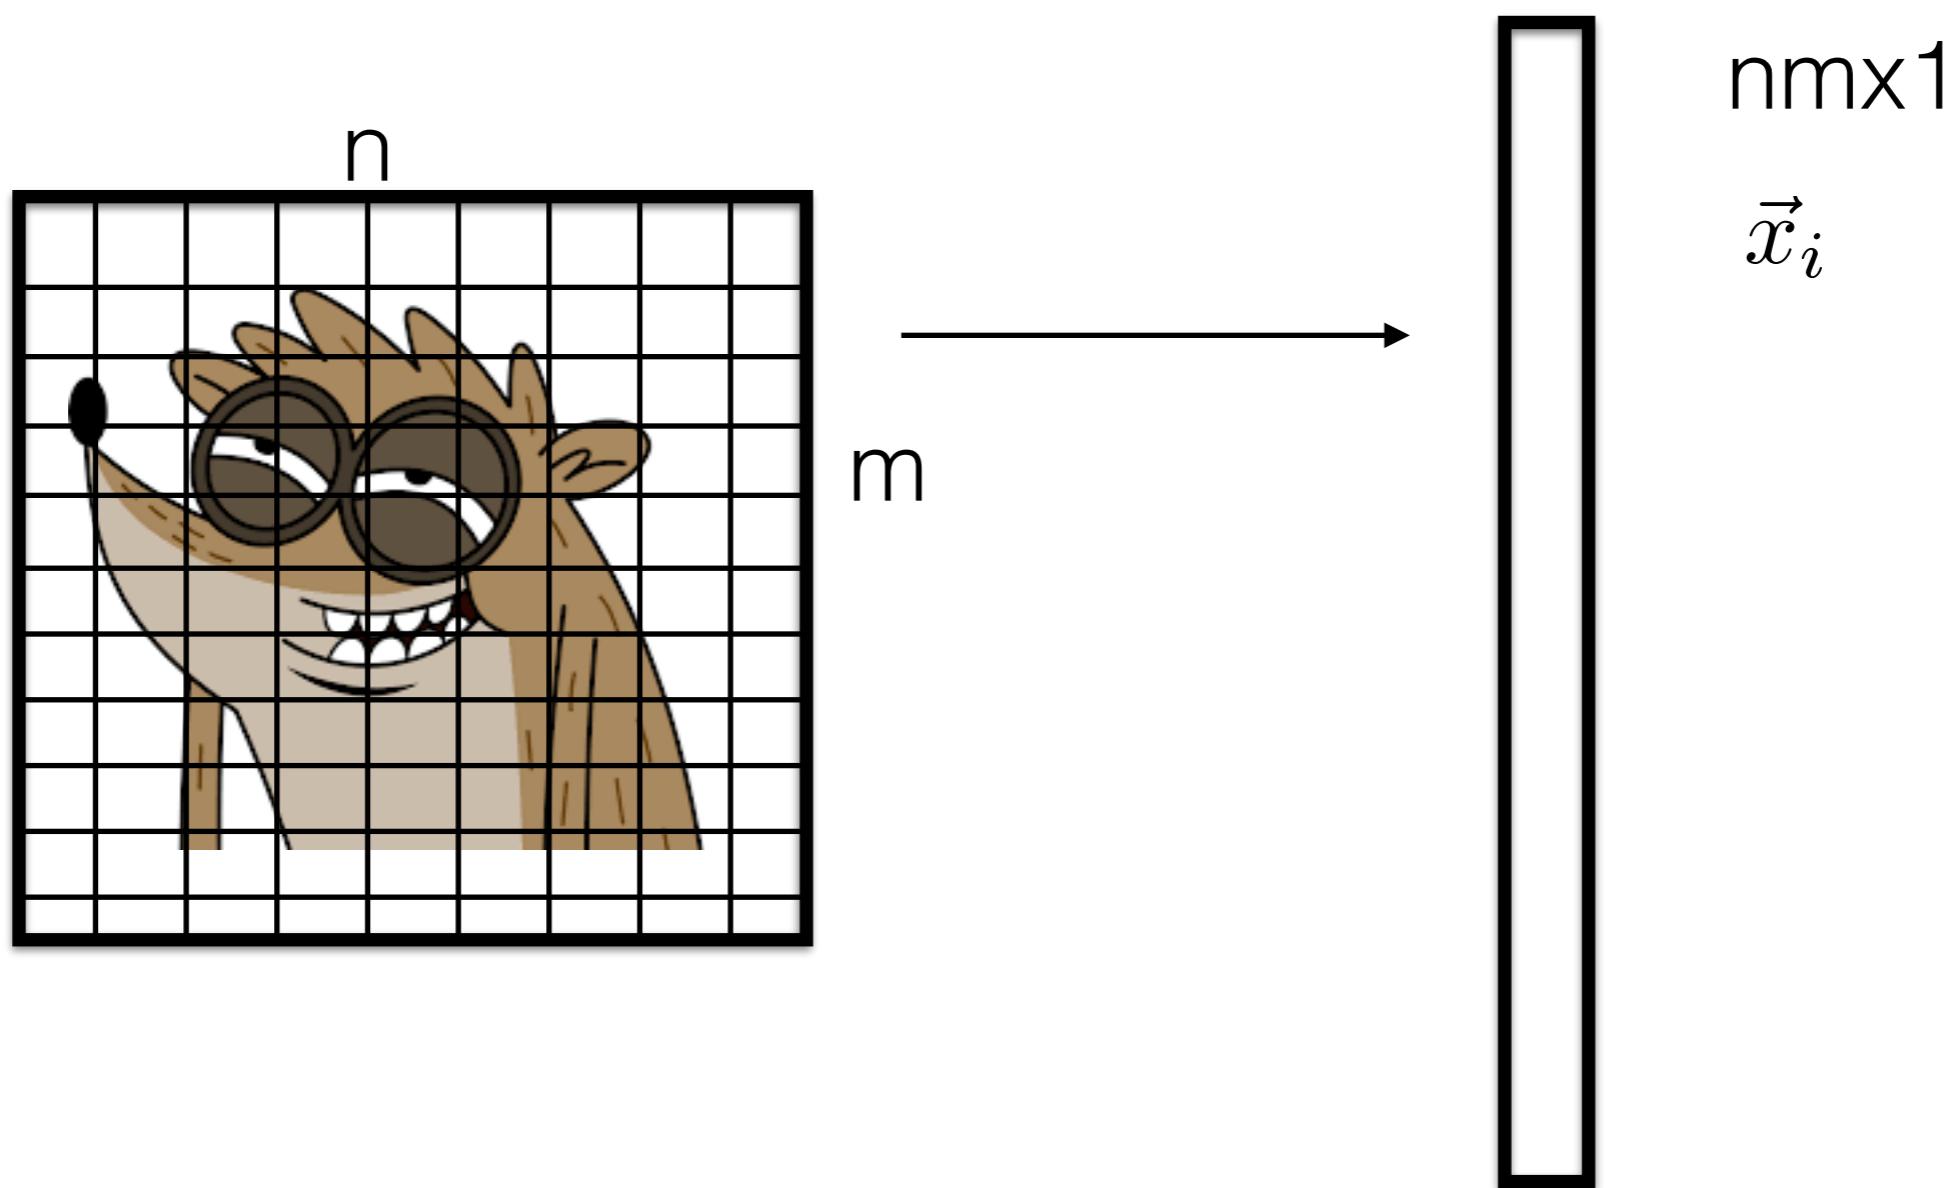

---

## SHAPE DESCRIPTION: HIGH DIMENSION?

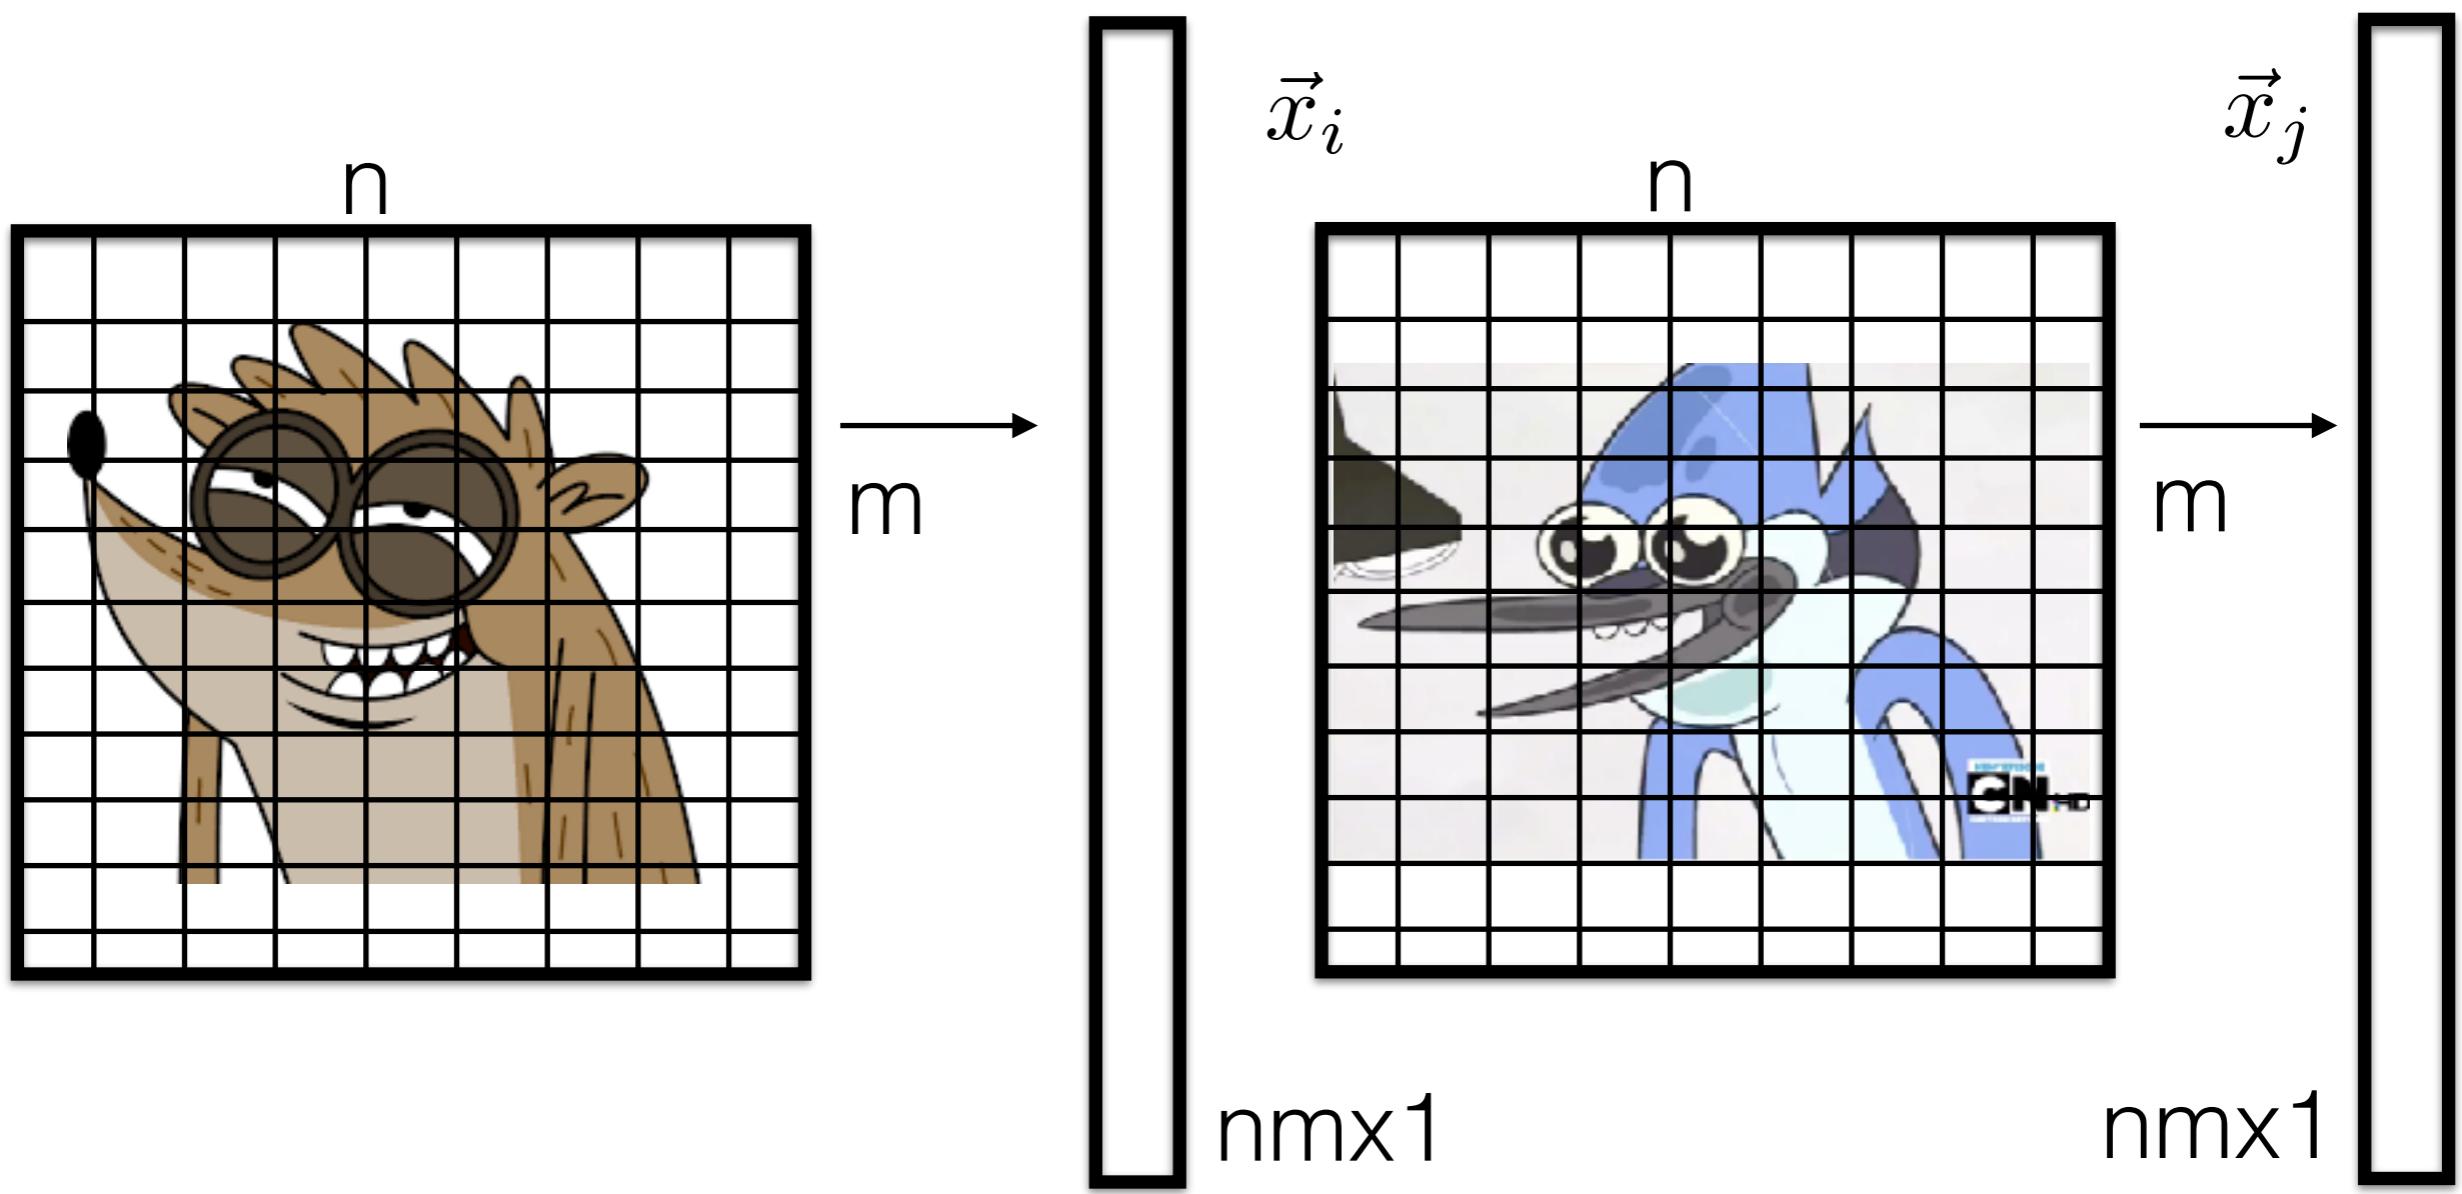

---

- ▶ How to understand an image in high dimension?

## SHAPE DESCRIPTION: HIGH DIMENSION?

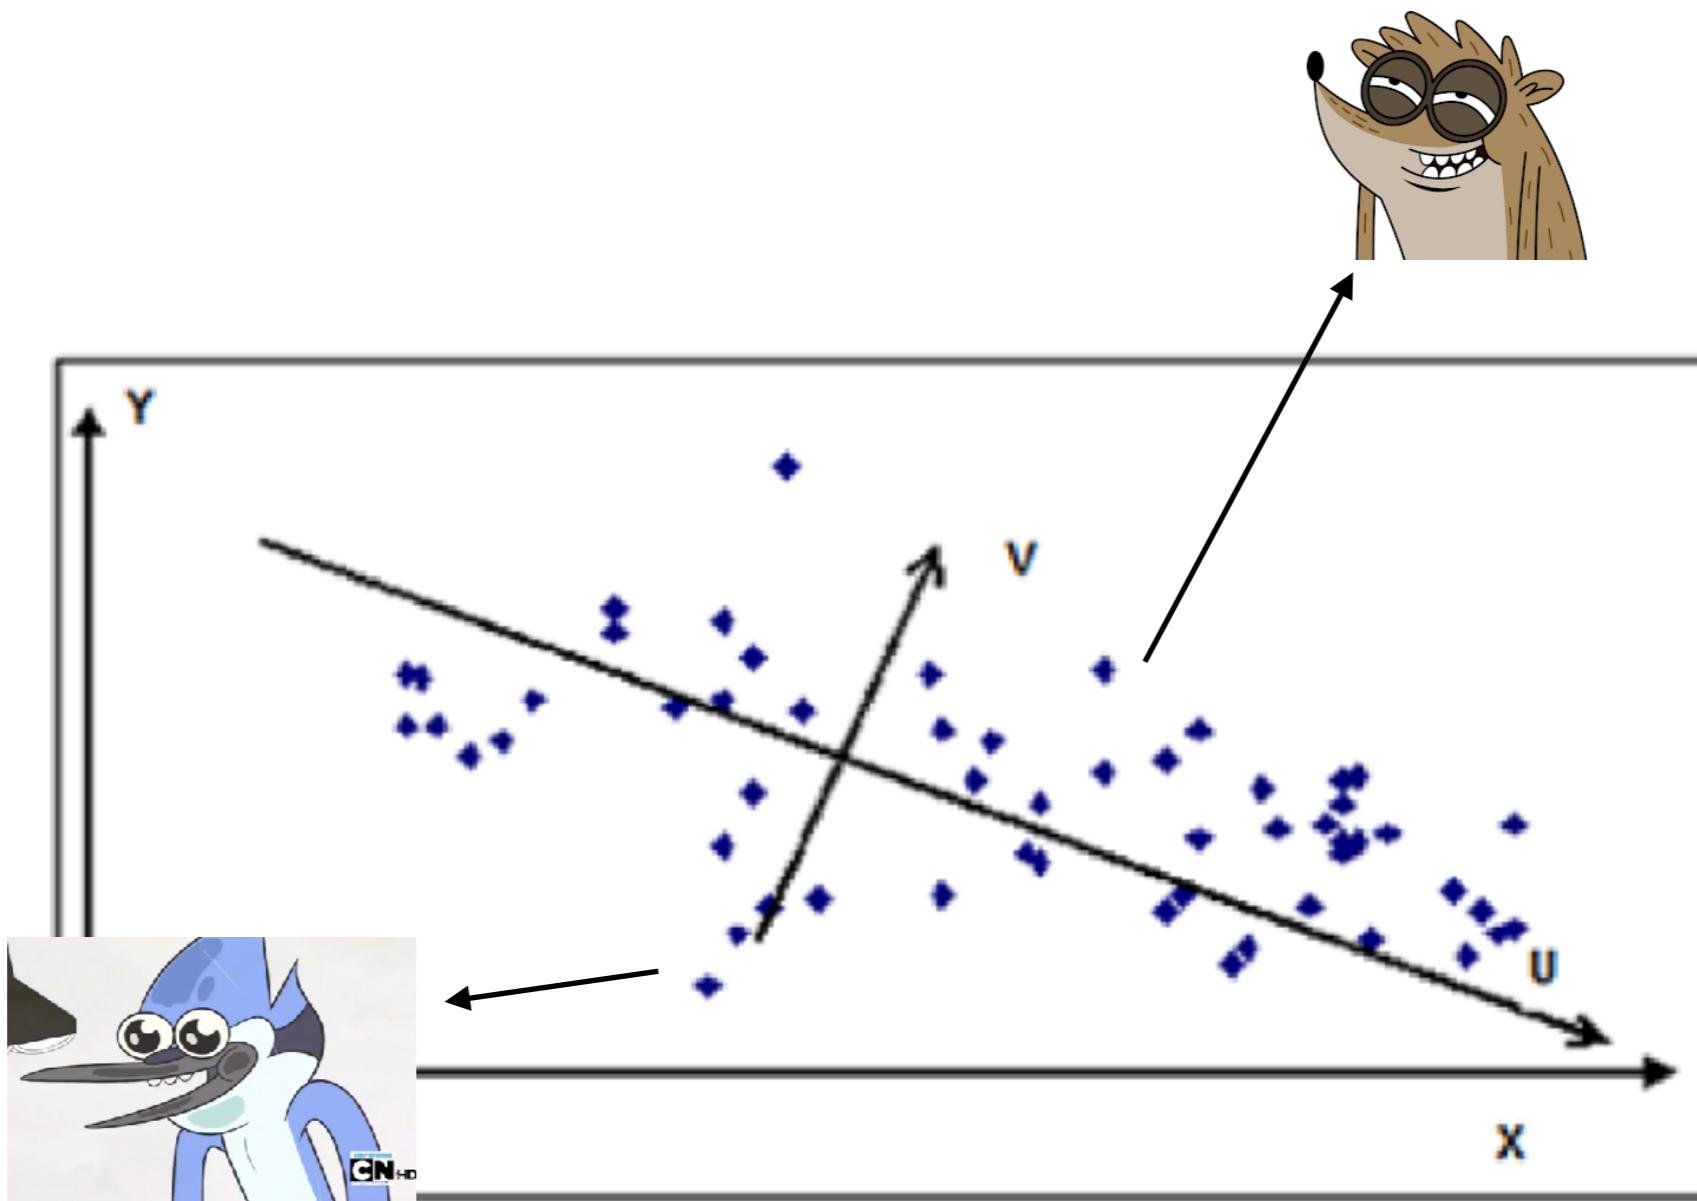

- ▶ For 2D images, we now have a  $nm$  size vector per image

## SHAPE DESCRIPTION: HIGH DIMENSION?

---

- ▶ Now, each image is a point in your feature space.

## SHAPE DESCRIPTION: COVARIANCE MATRIX

---

- ▶ Now, each image is a point in our feature space.

$$\mathbf{X} = [\vec{x}_1 \dots \vec{x}_i \dots \vec{x}_k] \quad (\text{column vector})$$

$$\mu_i = E(\vec{x}_{:,i}) \quad (\text{mean of row } 1)$$

$$\Sigma_{ij} = cov(\vec{x}_{:,i}, \vec{x}_{:,j}) = E[(\vec{x}_{:,i} - \mu_i)(\vec{x}_{:,j} - \mu_j)]$$

$$\Sigma = \begin{bmatrix} E[(\vec{x}_{:,1} - \mu_1)(\vec{x}_{:,1} - \mu_1)] & E[(\vec{x}_{:,1} - \mu_1)(\vec{x}_{:,2} - \mu_2)] & \cdots & E[(\vec{x}_{:,1} - \mu_1)(\vec{x}_{:,k} - \mu_k)] \\ \vdots & \ddots & & \vdots \\ E[(\vec{x}_{:,k} - \mu_k)(\vec{x}_{:,1} - \mu_1)] & E[(\vec{x}_{:,k} - \mu_k)(\vec{x}_{:,2} - \mu_2)] & \cdots & E[(\vec{x}_{:,k} - \mu_k)(\vec{x}_{:,k} - \mu_k)] \end{bmatrix}$$

## SHAPE DESCRIPTION: COVARIANCE MATRIX

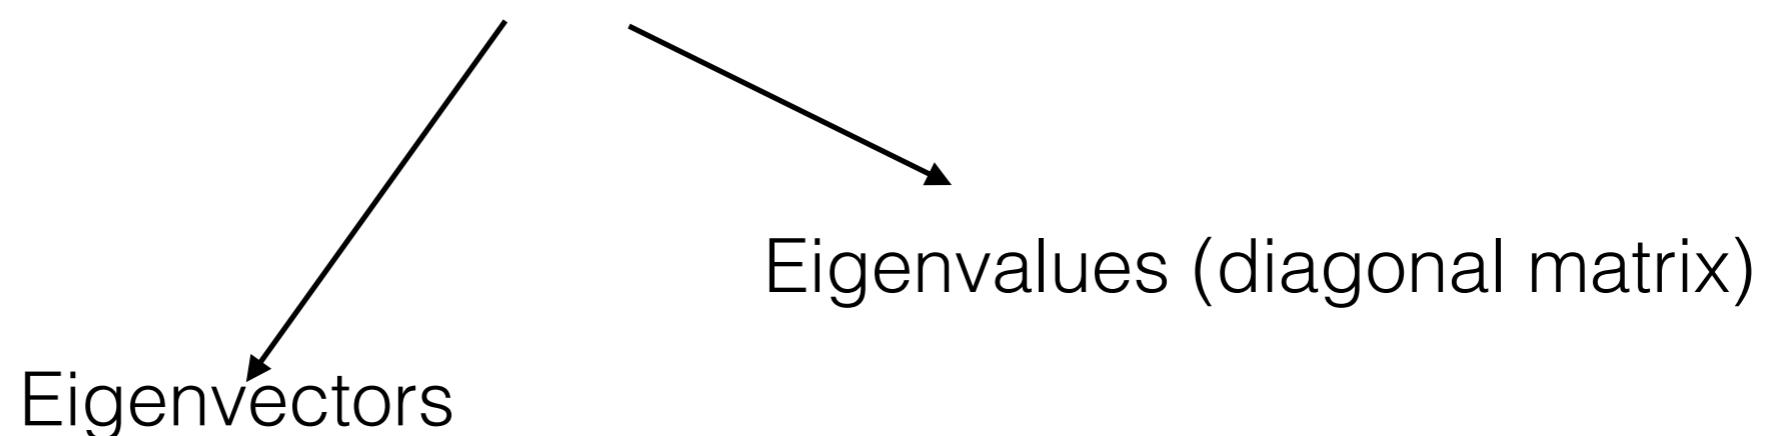

---

- ▶ If  $\mu_i = 0$  (centered data)

$$\Sigma = \frac{1}{k} \mathbf{X}^T \mathbf{X}$$

- ▶ We can diagonalize the matrix (eg. using SVD)

$$\Sigma = \mathbf{U} \mathbf{D} \mathbf{V}^T$$

## SHAPE DESCRIPTION: PCA

---

- ▶ If eigenvalues are sorted from higher to lower.
- ▶ The first eigenvector will indicate the direction that maximizes variance.
- ▶ If the input vector are size nm, how many eigenvector are in the base?

## SHAPE DESCRIPTION: PCA AS DESCRIPTOR

---

- ▶ Example. Face representation (*eigenfaces*) from a set of  $k$  photos form the same person.

...

1

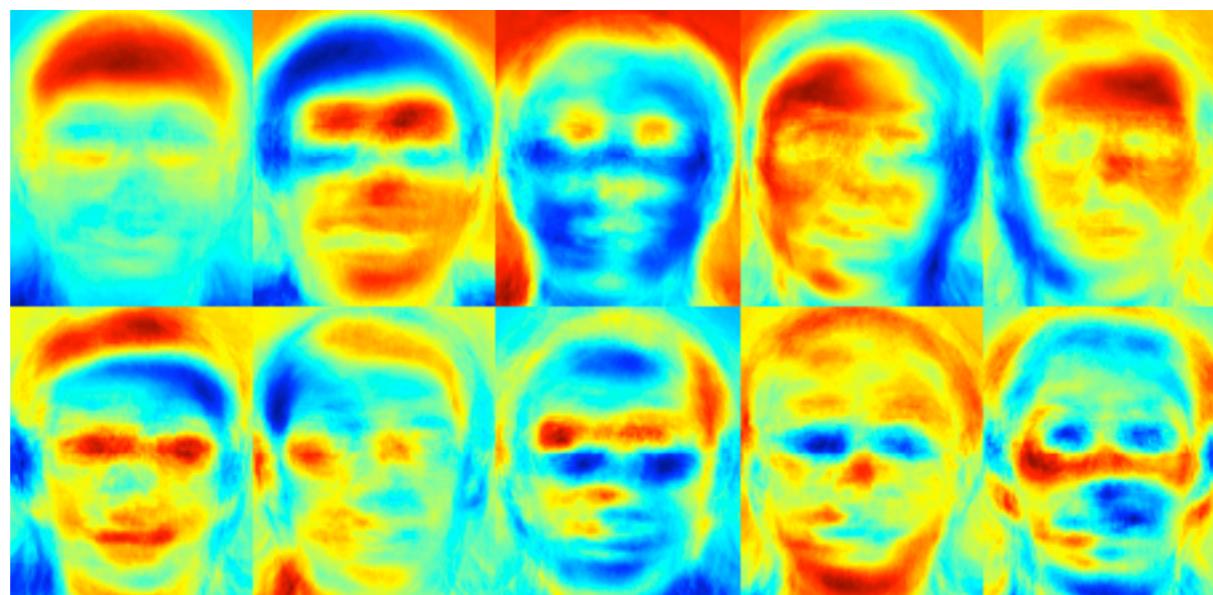

2

$k$

## SHAPE DESCRIPTION: PCA AS DESCRIPTOR

---

- ▶ Example. Face representation (eigenfaces). The first 10 eigenvectors are:

## SHAPE DESCRIPTION: PCA AS DESCRIPTOR

---

- ▶ Example. Face representation (eigenfaces). We can use it as a way to reduce dimensionality:

$$\text{Face Image} \sim \lambda_1 \text{Eigenface}_1 = \text{Reconstructed Face}$$

$$\text{Face Image} \sim \lambda_1 \text{Eigenface}_1 + \lambda_2 \text{Eigenface}_2 = \text{Reconstructed Face}$$

$$\text{Face Image} \sim \lambda_1 \text{Eigenface}_1 + \lambda_2 \text{Eigenface}_2 + \lambda_3 \text{Eigenface}_3 = \text{Reconstructed Face}$$
